Future Works

CIC

- CIC is type system of 'Coq'
 - Coq is one of the theorem prover
- CIC is a extention of $CC(\lambda P\omega)$
 - CC is the strongest type system in λ -Cube
 - $CIC = CC + Type_i + (Co)Inductive-Type$
 - $CIC^- = CC + Type_i$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ ののの

A semantics of type system

	t:T	$f: A \to B$	$f: \forall x: A.B$
	t is a element	f is a function	f is a function which maps a
Set theory	of Set(Class?) T	from A to B	into some element of $B(a)$
		f is a function(method)	
	t is a variable	which returns type B	f is a dependent
Programming	whose type is T	with A type argument	type function(method)
	t is a proof	f is a proof of	f is a proof of
Proof theory	of a proposition T	a proposition $A \Rightarrow B$	a Proposition $\forall x \in A, B(x)$

Examples of Model of Type Theory

- Set Theory
- Partial Equivalence Relation

- Topological Space
- Coherence Space
- Presheaf

Definition of Term and Context

Definition (Term)

- Type_i is a term (i = 0, 1, 2, 3, 4, ...).
- Prop is a term.
- x is a term for $x \in V$.
- If t_1 and t_2 is a terms, then t_1t_2 is a term.
- If t and T is a term, and $x \in V$ then, $\lambda x : T.t$ is a term.
- If T_1 and T_2 is a term, and $x \in V$ then $\forall x : T_1.T_2$ is a term.
 - If x dosn't freely appear in B, $\forall x : A.B$ is denoted as $A \rightarrow B$.

Definition (Context)

- [] is Context.
- If Γ is Context, T is a term and $x \in V$, then Γ ; (x : T) is Context.

Typing-Rule1

$\Gamma \vdash \operatorname{Prop}: \operatorname{Type}_i$	$\Gamma \vdash \mathrm{Type}_i : \mathrm{Type}_{i+1}$
$\frac{\Gamma \vdash A: \operatorname{Prop}}{\Gamma \vdash A: \operatorname{Type}_i}$	$\frac{\Gamma \vdash A: \mathrm{Type}_i}{\Gamma \vdash A: \mathrm{Type}_{i+1}}$
$\frac{\Gamma \vdash A: \mathrm{Type}_i \Gamma; (x:A) \vdash B: \mathrm{Type}_j}{\Gamma \vdash \forall x: A.B: \mathrm{Type}_{\max(i,j)}}$	$\frac{\Gamma \vdash A: \operatorname{Prop} \Gamma; (x:A) \vdash B: \operatorname{Type}_j}{\Gamma \vdash \forall x: A.B. \operatorname{Type}_j}$
$\frac{\Gamma \vdash A: \mathrm{Type}_i \Gamma; (x:A) \vdash Q: \mathrm{Prop}}{\Gamma \vdash \forall x: A.Q: \mathrm{Prop}}$	$\frac{\Gamma \vdash P: \operatorname{Prop} \Gamma; (x:A) \vdash Q: \operatorname{Prop}}{\Gamma \vdash \forall x: P.Q: \operatorname{Prop}}$

Typing-Rule2

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Merit of "Prop"

"Prop" enables to represent of higher order logic

- ▶ The type of "Predicate on Type 'A"' is $A \to Prop$
- $\blacktriangleright \ \forall P: A \to \operatorname{Prop}, Q(P): \operatorname{Prop}$
- "Prop" represent other logical symbol as following:

$$\blacktriangleright \perp := \forall P : \operatorname{Prop} P$$

$$\blacktriangleright \ \neg A := A \to \bot$$

- $\blacktriangleright \ \exists x: A.B := \forall P: \operatorname{Prop.}(\forall x: A, (B(x) \to P)) \to P$
- $A \land B := \forall P : \operatorname{Prop}(A \to B \to P) \to P$
- $\blacktriangleright A \lor B := \forall P : \operatorname{Prop.}(A \to P) \to (B \to P) \to P$

- $\bullet \ A \leftrightarrow B := A \to B \land B \to A$
- $\blacktriangleright \ x =_A y := \forall P : \operatorname{Prop}, Px \leftrightarrow Py$

Definition (Propositional Term and Proof Term)

The term P is called Propositional term in Γ iff $\Gamma \vdash P$: Prop is derivable. And more, The term t is called Proof term in Γ iff $\Gamma \vdash t : P$ is derivable for some P which is Propositional term in Γ .

Definition (Provable Propositional term)

Let P be Propositional term in Γ . P is called Provable Propositional term if there exists therm t such that $\Gamma \vdash t : P$ is derivable.

Idea of Model

- ► Soundness of CIC⁻ is showed by B.Werner.
- He shows following theorem in his paper "Sets in Types, Types in Sets"

Theorem (Soundness)

- If $\Gamma \vdash t : T$ is derivable, then $\llbracket \Gamma \vdash t \rrbracket(\gamma) \in \llbracket \Gamma \vdash T \rrbracket(\gamma)$ for all $\gamma \in \llbracket \Gamma \rrbracket$
- If $\Gamma \vdash t_1 : T$ and $t_1 \rightarrow_{\beta} t_2$, then $\llbracket \Gamma \vdash t_1 \rrbracket(\gamma) = \llbracket \Gamma \vdash t_2 \rrbracket(\gamma)$ for all $\gamma \in \llbracket \Gamma \rrbracket$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Where $\llbracket \Gamma \vdash T \rrbracket$ is a function whose domain is $\llbracket \Gamma \rrbracket$

Preparation(Dependent Function)

Definition (Dependent Function)

Let A be a set, and B(a) is a set with parameter $a \in A$.

$$\begin{split} &\bigotimes_{a \in A} B(a) &:= \{ p \in A \times \bigcup_{a \in A} B(a) \mid \forall a, b, (a, b) \in p \Rightarrow b \in B(a) \} \\ &\prod_{a \in A} B(a) &:= \{ f \subset \bigotimes_{a \in A} B(a) \mid \forall a \in A, \exists ! b \in B(a), (a, b) \in f \} \end{split}$$

Dependent Function is a function with range B(a) with a parameter $a \in A$, i.e.

$$f \in \prod_{a \in A} B(a) \Rightarrow \forall a \in A, f(a) \in B(a)$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Preparation(Universe)

Definition (Universe)

Let $\mathcal{U}(i)$ be i-th Grothendieck Universe, i.e.

• $\mathcal{U}(i)$ is Grothendieck Universe for each i

•
$$\mathcal{U}(i) \in \mathcal{U}(i+1)$$
 for each i

Lemma

 $A \in \mathcal{U}(i)$ and $B(a) \in \mathcal{U}(i)$ for each $a \in A$ imply $\prod_{a \in A} B(a) \in \mathcal{U}(i)$.

Notation of topological space

Let $(X, \mathcal{O}(X))$ be a topological space.

- $\blacktriangleright \ \mathbb{I} := X$
- $\blacktriangleright \ \mathbb{O} := \phi$

$$\blacktriangleright \bigsqcup S := \bigcup S$$

$$\blacktriangleright \prod S := \bigsqcup \{t \mid \forall s \in S, t \subset s\} = \left(\bigcap S\right)^{\circ}$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

$$\blacktriangleright \ b^a := \bigsqcup\{t \mid t \sqcap a \le b\}$$

Let p be a point of X such that following condition holds.

$$\bigcap \mathcal{N}(p) \text{ is open set.}$$
(1)

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

where $\mathcal{N}(p)$ is open neighborhood, i.e.

$$\mathcal{N}(p) := \{ O \in \mathcal{O}(X) | p \in O \}$$

We will consider the model with parameter $p(\in X)$ satisfying above condition.

Interpretation(Context)

Definition (Strict Interpretation of Judgement)

$$\llbracket \Gamma \vdash A \rrbracket'(\gamma) := \begin{cases} \llbracket \Gamma \vdash A \rrbracket(\gamma) \cap \{p\} & (A \text{ is Propositional Term}) \\ \llbracket \Gamma \vdash A \rrbracket(\gamma) & (otherwise) \end{cases}$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Definition (Interpretation of Context)

 $\blacktriangleright \ \llbracket \Gamma; (x:A) \rrbracket := \{ (\gamma, \alpha) | \alpha \in \llbracket \Gamma \vdash A \rrbracket'(\gamma) \}$

Interpretation(Judgement)

Definition (Interpretation of Judgement)

• $\llbracket \Gamma \vdash t \rrbracket(\gamma) := p$ (If t is Proof term in Γ)

•
$$\llbracket \Gamma \vdash \operatorname{Type}_i \rrbracket(\gamma) := \mathcal{U}(i)$$

- $\llbracket \Gamma \vdash \operatorname{Prop} \rrbracket(\gamma) := \mathcal{O}(X)$
- $\blacktriangleright \ \llbracket \Gamma \vdash \lambda x : A.T \rrbracket(\gamma) := \{ \bigl(\alpha, \llbracket \Gamma; (x : A) \vdash T \rrbracket(\gamma, \alpha) \bigr) | \alpha \in \llbracket \Gamma \vdash A \rrbracket(\gamma) \}$
- $\blacktriangleright \ \llbracket \Gamma \vdash t_1 t_2 \rrbracket (\gamma) := \llbracket \Gamma \vdash t_1 \rrbracket (\gamma) \bigl(\llbracket \Gamma \vdash t_2 \rrbracket (\gamma) \bigr)$

$$\blacktriangleright \ \llbracket \Gamma \vdash x_i \rrbracket(\gamma) := \gamma_i$$

$$\blacktriangleright \ \llbracket \Gamma \vdash \forall x : A.B \rrbracket(\gamma)$$

$$:= \llbracket \Gamma; (x:A) \vdash B \rrbracket (\gamma, p)^{\llbracket \Gamma \vdash A \rrbracket (\gamma)}$$
(when A, B are both Propositional term)
$$\min \left\{ \llbracket \Gamma; (x:A) \vdash B \rrbracket (\gamma, z) \right\} \in \mathbb{C} \llbracket \Gamma \vdash A \rrbracket$$

 $:= \min\{ \llbracket \Gamma; (x:A) \vdash B \rrbracket (\alpha, \gamma) | \alpha \in \llbracket \Gamma \vdash A \rrbracket (\gamma) \}$ (when *B* is Propositional term)

$$\begin{split} \bullet \ := \prod_{\alpha \in \llbracket \Gamma \vdash A \rrbracket'(\gamma)} \llbracket \Gamma; (x:A) \vdash B \rrbracket(\gamma, \alpha) \\ (\text{Otherwise}) \end{split}$$

Soundness

Theorem Following conditions hold:

$$\begin{split} & \llbracket \Gamma \vdash \bot \rrbracket = \phi \\ & \llbracket \Gamma \vdash A \land B \rrbracket(\gamma) = (\llbracket \Gamma \vdash A \rrbracket(\gamma)) \sqcap (\llbracket \Gamma \vdash B \rrbracket(\gamma)) \\ & \llbracket \Gamma \vdash A \lor B \rrbracket(\gamma) = (\llbracket \Gamma \vdash A \rrbracket(\gamma)) \sqcup (\llbracket \Gamma \vdash B \rrbracket(\gamma)) \\ & \llbracket \Gamma \vdash \exists x : A.Q \rrbracket(\gamma) = \bigsqcup_{\alpha \in \llbracket \Gamma \vdash A \rrbracket(\gamma)} \llbracket \Gamma; (x : A) \vdash Q \rrbracket(\gamma, \alpha) \end{split}$$

Theorem (Soundness)

- If $\Gamma \vdash t : T$ is derivable, then $\llbracket \Gamma \vdash t \rrbracket(\gamma) \in \llbracket \Gamma \vdash T \rrbracket(\gamma)$ for all $\gamma \in \llbracket \Gamma \rrbracket$
- If $\Gamma \vdash t_1 : T$ and $t_1 \rightarrow_{\beta} t_2$, then $\llbracket \Gamma \vdash t_1 \rrbracket(\gamma) = \llbracket \Gamma \vdash t_2 \rrbracket(\gamma)$ for all $\gamma \in \llbracket \Gamma \rrbracket$
 - If P is provable propositional term in Γ , then $p \in \llbracket \Gamma \vdash P \rrbracket(\gamma)$.

Example

The reason of point condition

The reason of the condition " $\bigcap \mathcal{N}(p)$ is open set" is ...

- This condition is needed in proof of soundness
- Let P be Propositional term
 - If P is true, then $p \in \llbracket \Gamma \vdash P \rrbracket(\gamma)$ should hold.
 - ► The condition that $p \in \llbracket \Gamma; (x : A) \vdash P \rrbracket(\gamma, \alpha)$ iff $p \in \llbracket \Gamma \vdash \forall x : A.P \rrbracket(\alpha)$ is needed.
 - But...
 - $$\begin{split} & \quad \llbracket \Gamma \vdash \forall x : A.P \rrbracket(\gamma) = (\bigcap \{ \llbracket \Gamma; (x : A) \vdash P \rrbracket(\gamma, \alpha) | \alpha \in \llbracket \Gamma \vdash A \rrbracket(\gamma) \})^{\circ} \end{split}$$

► $p \in \llbracket \Gamma; (x : A) \vdash P \rrbracket(\gamma, \alpha)$ dose NOT imply $p \in \llbracket \Gamma \vdash \forall x : A.P \rrbracket(\gamma)$

Paradox

 $\mathsf{J}.\mathsf{Reynolds}$ showed following theorem in his paper "Polymorphism is not set-theoretical"

Theorem

If P is Propositional term, $2 \leq mathbb{l} \{ \llbracket \Gamma \vdash t \rrbracket(\gamma) \mid \Gamma \vdash t : P \}$ causes paradox.

But I create the model which is any proof term is interpreted to JUST ONE element. Hence, this model is interpreted as if $[\Gamma \vdash P]$ has only one element.
