We are witnessing the beginning of a new era of knowledge economy and information society, which can be jointly called the era of knowledge and informational civilization. In this era, it is necessary to better understand the processes of knowledge creation. Philosophy has investigated knowledge creation for millennia, but has concentrated in the last fifty years on macro-theories of knowledge creation on a grand historical scale; the knowledge economy, on the other hand, requires micro-theories of knowledge creation applicable to today and tomorrow. Therefore, many new micro-theories of knowledge and technology creation have emerged in the last decade of the 20th Century, from fields outside of philosophy. In this project we are integrating such diverse micro-theories of knowledge creation, necessary as the foundation for diverse applications in knowledge management and knowledge engineering for a better understanding of knowledge creation processes. Now, we are at the beginning stages of the knowledge and information civilization era. In this project we are trying to construct knowledge maps which include information about universities, institutes, or researchers related to our activity in the world.
