

Is movement duration predetermined in visually guided reaching?  
A comparison of finite- and infinite-horizon optimal feedback control

## Background

### Problems that brain faces during movement

This question had already been answered by many researchers.

How to decide the trajectory? (space)  
How to determine the duration? (time)

Whether brain prefixes the movement duration before onset?

## Previous study

Answer the question by comparing two theories

### Finite-horizon control theory:

Movement duration is determined before onset based on certain criterion and that movement is optimized over that finite duration.

$$J = \int_0^{t_f} L[x(t), u(t)] dt$$

$$\text{Kalman gain: } K(t) = P_{22}(t)C^T(DD^T)^{-1}$$

$$\text{Control gain: } L(t) = (R + \gamma^T(S_{11}(t) + S_{22}(t))\gamma)^{-1}B^T S_{11}(t)$$

### Infinite-horizon control theory:

Movement duration is not predetermined and that movement is optimized over infinite period.

$$J = \int_0^{\infty} L[x(t), u(t)] dt$$

$$K = P_{22}C^T(DD^T)^{-1}$$

$$L = (R + \gamma^T(S_{11} + S_{22})\gamma)^{-1}B^T S_{11}$$

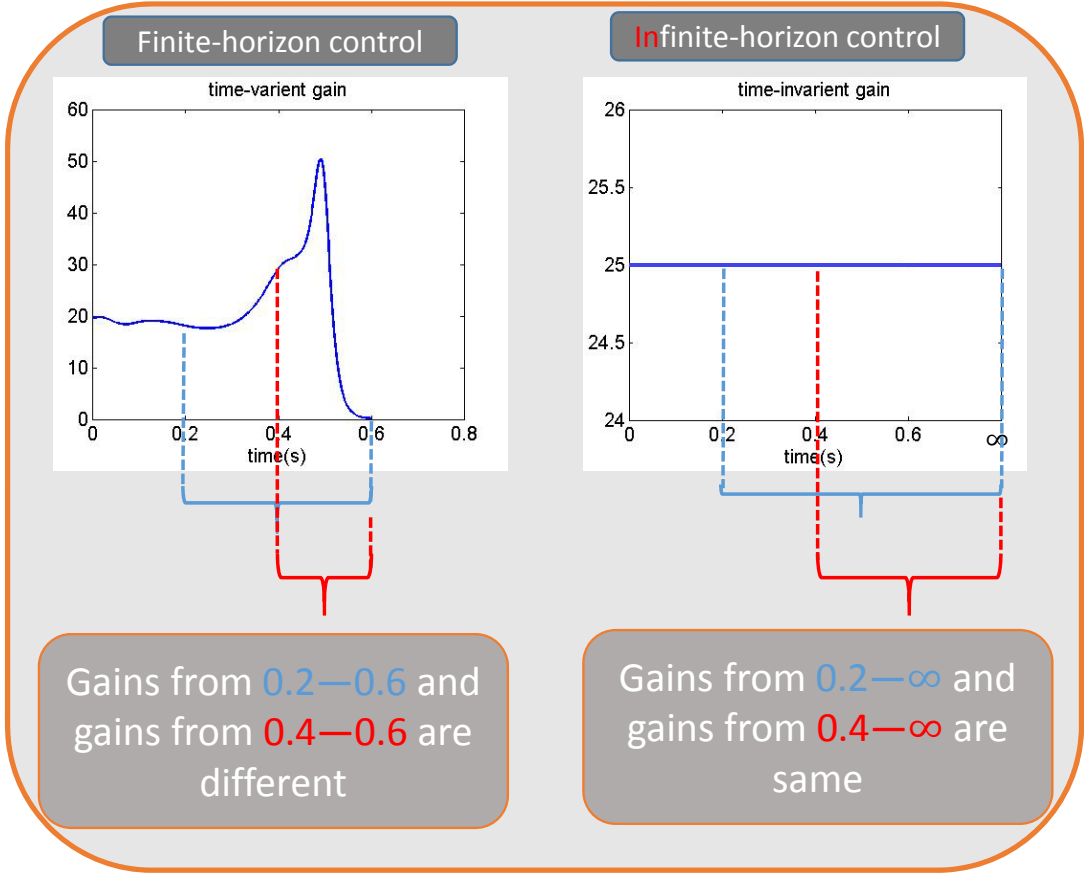

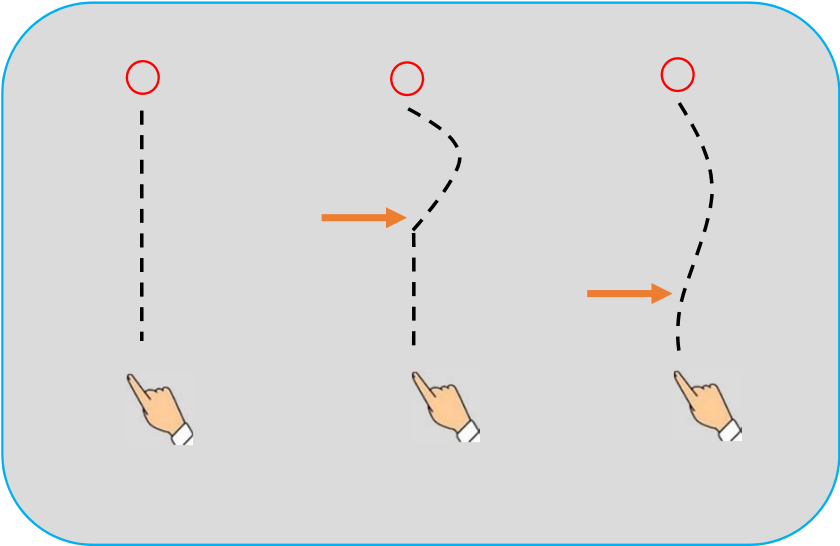

# Method

## Different kinds of gains lead to different correction styles

### Correct perturbations:

# Method

## Experiment design

Visual perturbation

Force perturbation

Target

Start position

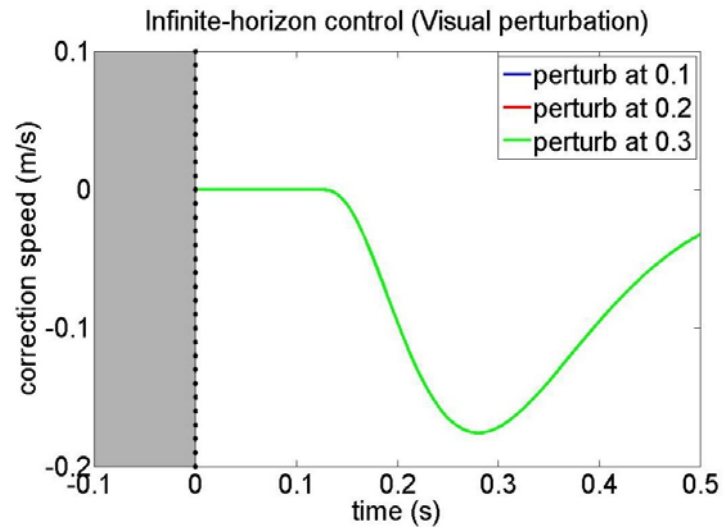

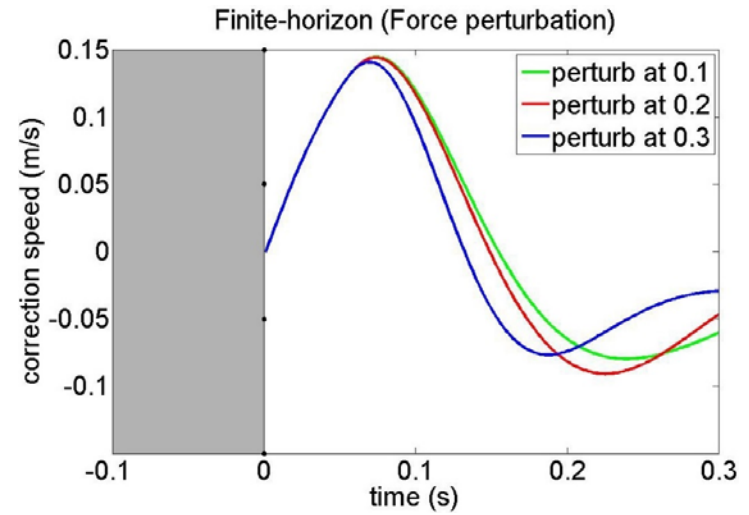

←→ push direction

Perturbation onset: 100ms/200ms/300ms  
Movement duration: 600ms  
Cursor displacement: 4cm  
Mechanical push: 10N × 0.05s

○ position after perturbation  
○ position before perturbation

# Simulation

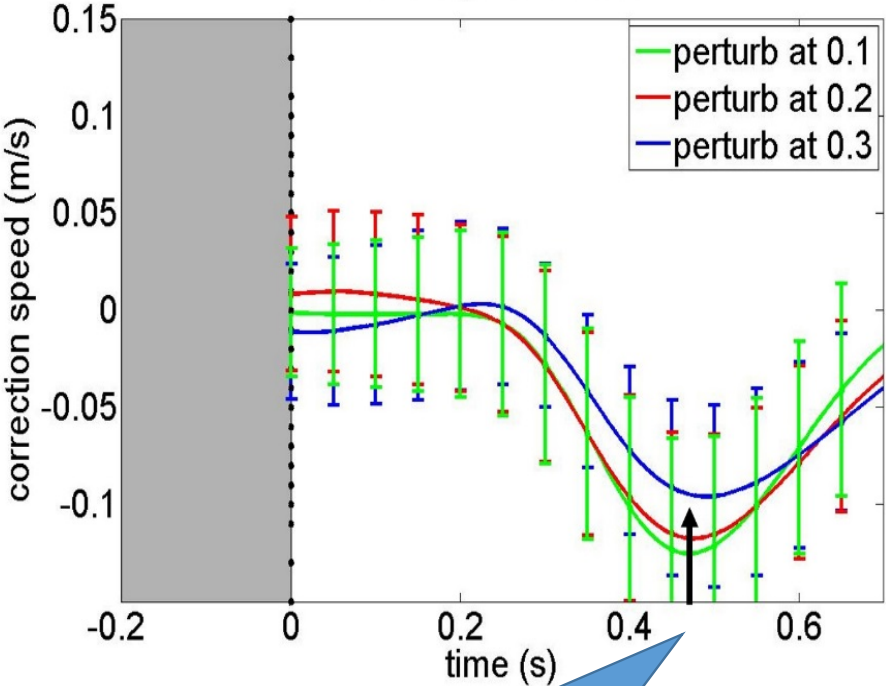

# Experiment data

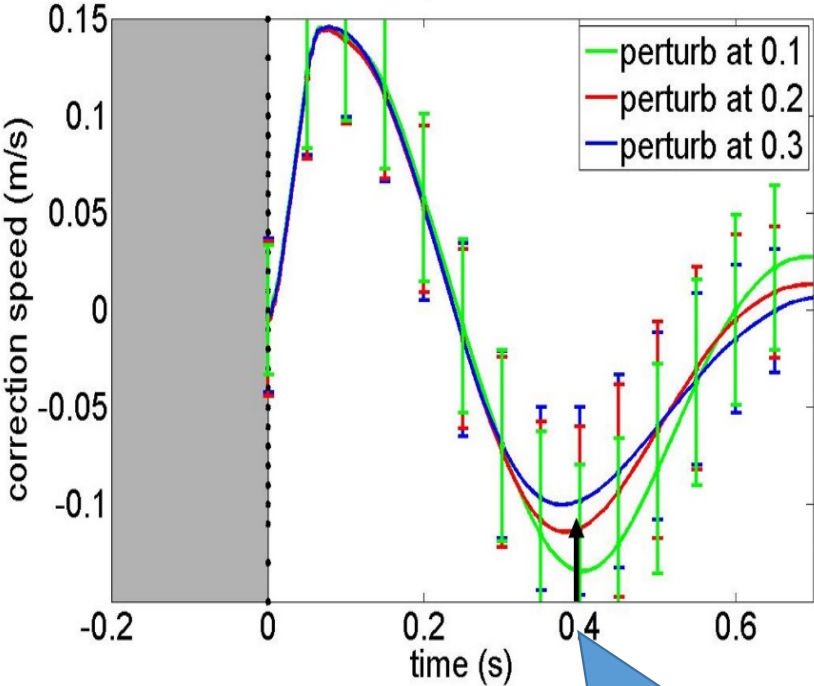

### Visual perturbation

ANOVA:  $p = 1.08933e-17$

### Force perturbation

ANOVA:  $p = 1.05755e-23$

## Summary& Conclusion

### Summary:

1. The question “whether brain prefixes a movement duration” can be answered by comparing finite-horizon control & infinite-horizon control.
2. These two theories can be compared by analyzing the corrections against different perturbation onsets.
3. Simulations under different theories are compared with experiment data.

### Conclusion:

Current experiment result is consistent with finite-horizon control theory, which means that brain does prefix the movement duration before onset, however, the data comes from only 6 subjects, more data is needed to confirm our conclusion.
