2

Review of ABP, Modeling & Specification

Sinaia School, Mar 03-10, 2008

3

Alternating Bit Protocol

- Sender puts a pair $\langle \text{bit1}, \text{pac} \rangle$ of the bit & a packet into fifo1 repeatedly.
- Receiver puts the bit bit2 into fifo2 repeatedly.
- When Sender gets a bit b from fifo2 , if b does not equal bit1 , Sender selects the next packet and alternates bit1 .
- When Receiver gets a pair $\langle b, p \rangle$ from fifo1 , if b equals bit2 , Receiver receives p and alternates bit2 .
- Data in the channels can be lost and/or duplicated.

Sinaia School, Mar 03-10, 2008

4

Observations

- Sender-to-Receiver channel
bop fifo1 : Sys -> PFifo
- Receiver-to-Sender channel
bop fifo2 : Sys -> BFifo
- Sender's bit
bop bit1 : Sys -> Bool
- Receiver's bit
bop bit2 : Sys -> Bool
- The ordinal of the packet sent next by Sender
bop next : Sys -> Nat
- The packets received by Receiver
bop list : Sys -> List

Sinaia School, Mar 03-10, 2008

5

Transitions

- Sender's sending pairs of bits & packets
bop send1 : Sys -> Sys
- Sender's receiving bits
bop rec1 : Sys -> Sys
- Receiver's sending bits
bop send2 : Sys -> Sys
- Receiver's receiving pairs of bits & packets
bop rec2 : Sys -> Sys
- Dropping the 1st of *fifo_i* (*i* = 1,2)
bop drop_i : Sys -> Sys
- Duplicating the 1st of *fifo_i* (*i* = 1,2)
bop dup_i : Sys -> Sys

Sinaia School, Mar 03-10, 2008

6

Specification of ABP

- Let us take a brief look at the file “abp.mod”.

Property to Verify

Reliable Com. Property (1)

- When Receiver receives the n th packet,
 - Receiver has received the $n+1$ packets p_0, \dots, p_n in this order,
 - each p_i for $i = 0, \dots, n$ has been received only once, and
 - no other packets have been received.

Reliable Com. Property (2)

- The reachable state space R_{ABP} is inductively defined as
 - init is in R_{ABP}
 - If s is in R_{ABP} , then so are $\text{send1}(s), \text{rec1}(s), \text{send2}(s), \text{rec2}(s), \text{drop1}(s), \text{dup1}(s), \text{drop2}(s)$ and $\text{dup2}(s)$.
- Let $\text{rc}(s)$ be the state predicate:
$$(\text{bit1}(s) = \text{bit2}(s) \text{ implies } \text{list}(s) = \text{pac}(\text{next}(s)-1) \dots \text{pac}(0)) \text{ and}$$
$$(\text{bit1}(s) \neq \text{bit2}(s) \text{ implies } \text{list}(s) = \text{pac}(\text{next}(s)) \dots \text{pac}(0))$$
- All we have to do is to prove $\text{rc}(s)$ for all s in R_{ABP} .

Housekeeping for Proof Scores

Sinaia School, Mar 03-10, 2008

11

Module INV

- The module INV is declared as follows:

```
mod INV { pr(ABP)
  op s : -> Sys
  op inv1 : Sys -> Bool
  var S : Sys
  eq inv1(S)
    = (bit1(S) = bit2(S))
      implies mk(next(S)) = (pac(next(S)) list(S))) and
      (not(bit1(S) = bit2(S)))
      implies mk(next(S)) = list(S)) .
}
```

where $\text{mk}(n) = \text{pac}(n) \dots \text{pac}(0)$

- Constant s denotes an arbitrary state.

Sinaia School, Mar 03-10, 2008

12

Module ISTEP

- The module ISTEP is declared as follows:

```
mod ISTEP { pr( INV )
    op s' : -> Sys
    op istep1 : -> Bool
    eq istep1 = inv1(s) implies inv1(s') .
}
```

- Constant s' denotes an arbitrary successor state of s .
- $\text{inv1}(s)$ is the induction hypothesis.
- $\text{inv1}(s')$ is the formula to prove in the induction case.

Proof Score Templates

- First write the *proof score (PS)*:

<pre>-->(I) Base case open INV red inv1(init) . close</pre>	<pre>-->(I) Induction case open ISTEP red istep1 . close</pre>
--	---

- Next split the ind. case into 8 sub-cases b/c there are the 8 transitions. See the file “template1.mod”.
- Then split each of the 6 fragments called *proof passages (PPs)* into two sub-cases b/c the corresponding transition has a non-trivial condition. See the file “template2.mod”.
- Finally rewrite some equations that characterize cases. See the file “template.mod”.

Proof Score Writing

Sinaia School, Mar 03-10, 2008

15

What to Do

- *Case splitting*

Split a proof passage into multiple proof passages based on 1. Boolean terms or 2. constructors

1. (1) p holds, and (2) p does not.
2. (1) $t = c_1(x_1, \dots), \dots, (n) t = c_n(x_n, \dots)$

- *Lemma discovery*

When CafeOBJ returns false for a proof passage or some contradiction is found in a proof passage, some lemmas should be conjectured and used.

Sinaia School, Mar 03-10, 2008

16

Appropriate Equations (1)

- Each case (each PP) is characterized by a set of equations.
- It would be better to make a set of equations used confluent & terminating.
- No perfect methods, but some heuristics.
- The 3 equations are equivalent.
 1. $c\text{-rec1}(s) = \text{true}$
 2. $(\text{fifo2}(s) = \text{empty}) = \text{false}$
 3. $\text{fifo2}(s) = b, bs$
where b is an arb. Boolean values & bs is an arb. queue of Boolean values.
- 2. (3.) is more appropriate than 1. (2.) in that 1. (2.) can be deduced with reduction when 2. (3.) is used but 2. (3.) may not when 1.(2.) is used.

Sinaia School, Mar 03-10, 2008

17

Case Splitting (1)

- Let us consider the proof passage:

```
open ISTEP
-- arbitrary values
op b : -> Bool .
op bs : -> BFifo .
-- assumptions
eq fifo2(s) = b,bs .
-- successor state
eq s' = recl(s) .
-- check
red istep1 .
close
```

- CafeOBJ returns $\text{mk}(\text{if } (\text{bit1}(s) = b) \text{ then } \dots) \dots$.
- “ $\text{bit1}(s) = b$ ” is a candidate used to split the proof passage.

Sinaia School, Mar 03-10, 2008

18

Case Splitting (2)

- The PP is split into the two PPs:

```
open ISTEP          open ISTEP
  op b : -> Bool .
  op bs : -> BFifo .
  eq fifo2(s) = b,bs .
  eq bit1(s) = b .
  eq s' = rec1(s) .
  red istep1 .
close               close
```

- CafeOBJ returns true for the left, but ... $b = \text{bit2}(s)$... for the right.
- " $b = \text{bit2}(s)$ " is a candidate used to split the right.

Case Splitting (3)

- The PP is split into the two PPs:

```
open ISTEP          open ISTEP
  op b : -> Bool .
  op bs : -> BFifo .
  eq fifo2(s) = b,bs .
  eq (bit1(s) = b) = false .
  eq bit2(s) = b .
  eq s' = rec1(s) .
  red istep1 .
close               close
```

```
open ISTEP
  op b : -> Bool .
  op bs : -> BFifo .
  eq fifo2(s) = b,bs .
  eq (bit1(s) = b) = false .
  eq (bit2(s) = b) = false .
  eq s' = rec1(s) .
  red istep1 .
```

- CafeOBJ returns true for the left, but does not for the right.
- We can split the right, but try to find a lemma, which can discharge it b/c the two equations seem to contradict.
- Note that $\text{bit2}(s) = b$ is used instead of $b = \text{bit2}(s)$.

Appropriate Equations (2)

- The 2 sets of equations are equivalent.
 1. $(\text{bit1}(s) = b) = \text{false}$
 $b = \text{bit2}(s)$
 2. $(\text{bit1}(s) = b) = \text{false}$
 $\text{bit2}(s) = b$
- 2. is more appropriate than 1. in that $\text{not}(\text{bit1}(s) = \text{bit2}(s))$ can be deduced with reduction when 2. is used but may not when 1. is used.

Appropriate Equations (3)

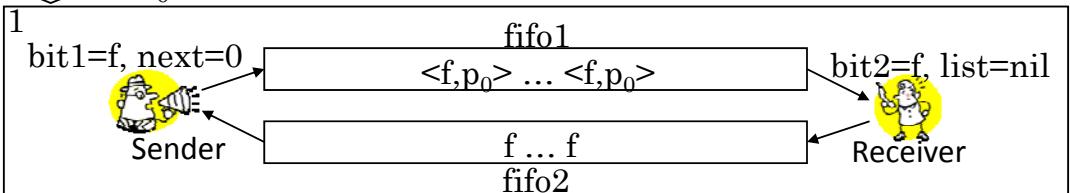

- The 2 sets of equations are equivalent.
 1. $b, b, bs = \text{bit1}, \text{bit2}, \text{bfifo}$
 2. $\text{bit1} = b, \text{bit2} = b, \text{and } \text{bfifo2} = bs$
- 2. is more appropriate than 1.
- The 2 sets of equations are equivalent.
 1. $(\text{fifo2}(s) = (\text{bfifo1} @ (\text{bit1}, \text{empty})) \text{ and } \text{bit2}(s) = \text{bit2}) = \text{true}$
 2. $\text{fifo2}(s) = (\text{bfifo1} @ (\text{bit1}, \text{empty}))$
 $\text{bit2}(s) = \text{bit2}$
- 2. is more appropriate than 1.

Snapshots of ABP (1)

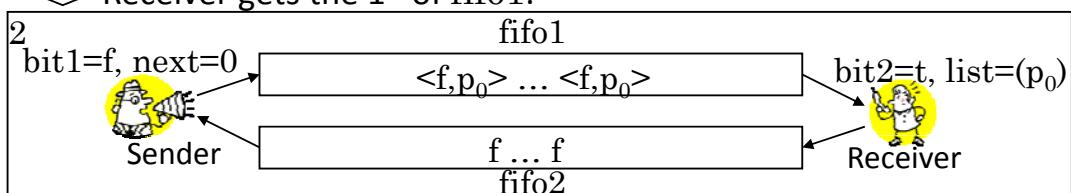

- Let us observe snapshots to conjecture lemmas.

 $\langle f, p_0 \rangle$ & f are put in fifo1 & fifo2.

 Receiver gets the 1st of fifo1.

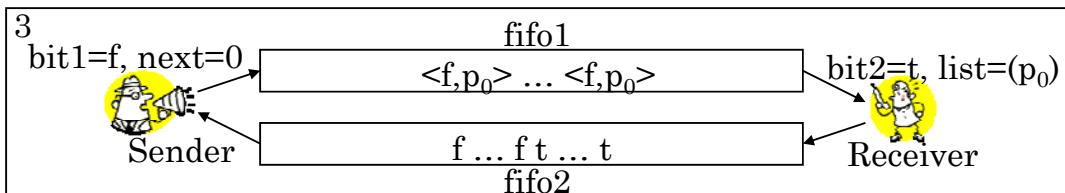

Sinaia School, Mar 03-10, 2008

23

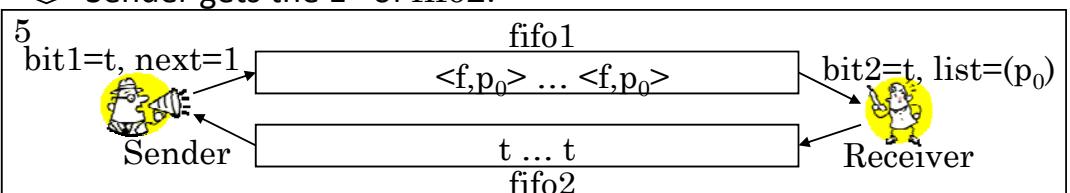

Snapshots of ABP (2)

\downarrow $\langle f, p_0 \rangle$ & t are put in fifo1 & fifo2.

The diagram shows two horizontal boxes representing FIFO queues. The top box is labeled "fifo1" and contains the sequence of elements $\langle f, p_0 \rangle \dots \langle f, p_0 \rangle$. The bottom box is labeled "fifo2" and contains the sequence of elements $t \dots t$. On the left, a character labeled "Sender" is connected to the input of fifo1. On the right, a character labeled "Receiver" is connected to the output of fifo1. Arrows indicate the flow of data from the Sender to fifo1 and from fifo1 to the Receiver.

 Sender gets the 1st of fifo2.

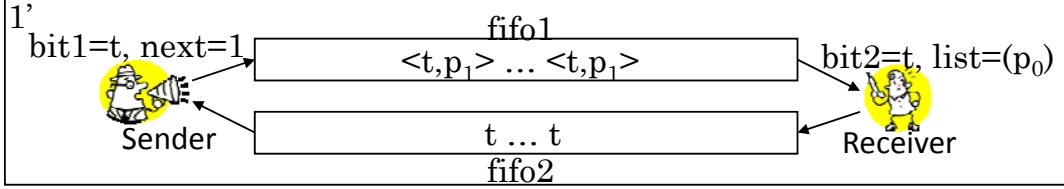

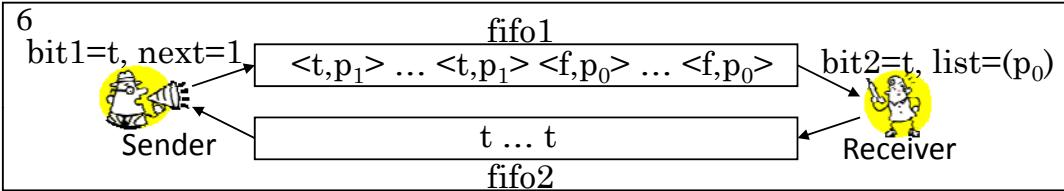

Sinaia School, Mar 03-10, 2008

24

Snapshots of ABP (3)

$\langle t, p_1 \rangle$ & t are put in fifo1 & fifo2.

- Snapshot 0 is a special case of snapshot 1.
- There are 6 patterns of snapshots: snapshot 1, ..., snapshot 6.

Lemma Discovery (1)

- From the 6 snapshots, the following lemma can be conjectured.

```
eq inv2(S) = not(fifo2(S) = empty)
implies ((bit1(S) = top(fifo2(S)))
          or (bit2(S) = top(fifo2(S)))) .
```

- `inv2` can be used to discharge the PP concerned.

```
open ISTEP
  op b : -> Bool .
  op bs : -> BFifo .
  eq fifo2(s) = b,bs .
  eq (bit1(s) = b) = false .
  eq (bit2(s) = b) = false .
  eq s' = recl(s) .
  red inv2(s) implies istep1 .
close
```

Lemma Discovery (2)

- Let us consider the proof passage:

```
open ISTEP
  op p : -> BPPair .  op ps : -> PFifo .
  eq fifo1(s) = p,ps .
  eq bit2(s) = fst(p) .
  eq (pac(next(s)) = snd(p)) = false .
  eq s' = rec2(s) .
  red istep1 .
close
```

- From snapshot 1, in which $\text{bit2}(s) = \text{fst}(p)$, the following lemma can be conjectured:

```
eq inv3(S)
  = (not(fifo1(S) = empty) and bit2(S) = fst(top(fifo1(S))))
    implies
    (bit1(S) = fst(top(fifo1(S)))
      and pac(next(S)) = snd(top(fifo1(S)))) .
```

Lemma Discovery (3)

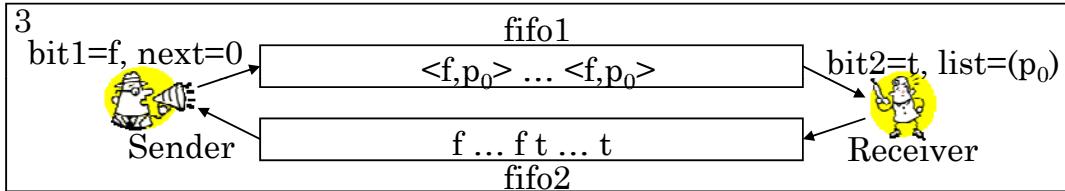

- Let us consider the proof passage:

```
open ISTEP
  op p : -> BPPair .  op ps : -> PFifo .
  eq fifo1(s) = p,ps .
  eq bit2(s) = fst(p) .
  eq pac(next(s)) = snd(p) .
  eq bit1(s) = fst(p) .
  eq (fst(p) = (fst(p) xor true)) = true .
  eq s' = rec2(s) .
  red implies istep1 .
close
```

- The following lemma on Boolean values can discharge the PP:

```
eq eqbool-lemma1(B) = not((not B) = B) .
```

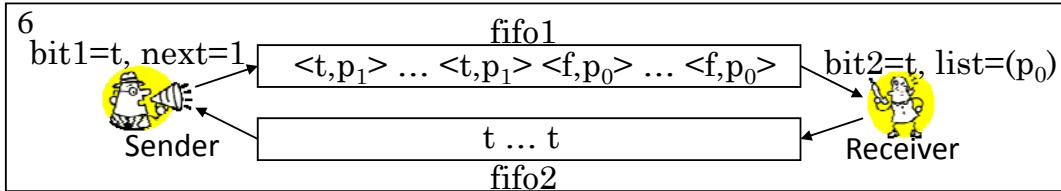

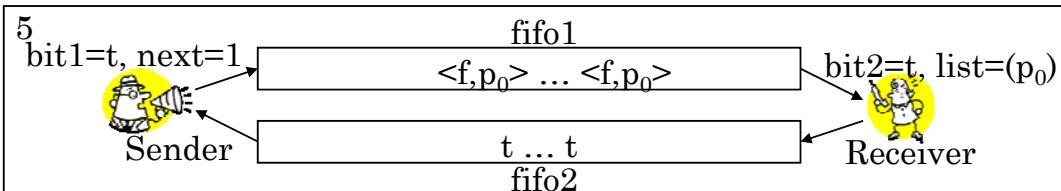

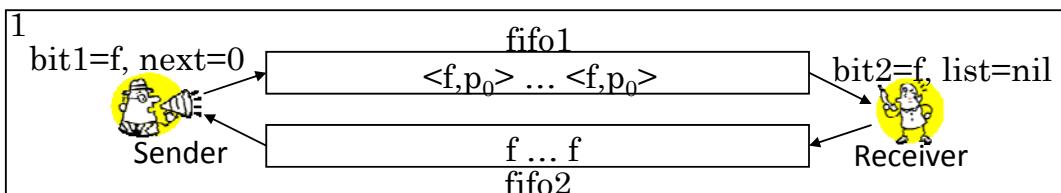

Lemma Discovery (4)

- This is the only snapshot where fifo2 contains both t & f.
- From this, the lemma can be conjectured.

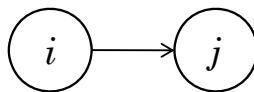

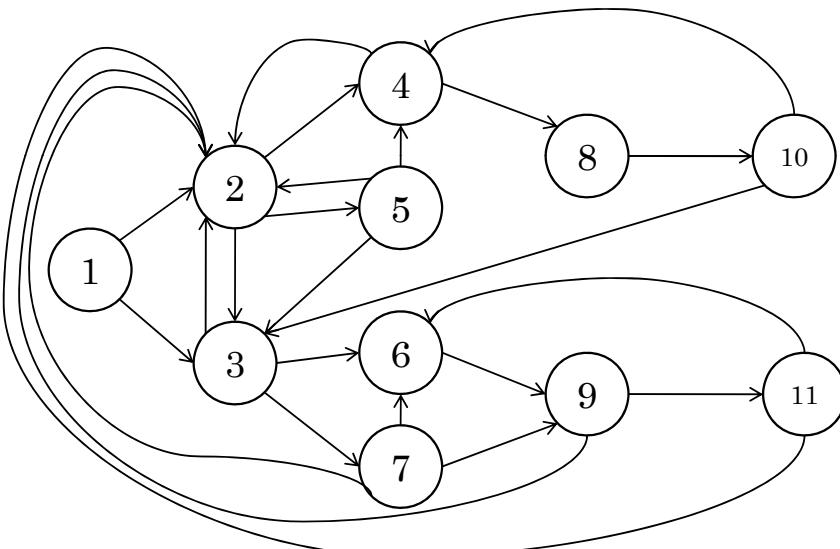

```
eq inv8(S,BIT1,BIT2,BIT3,BFIFO1,BFIFO2)
  = ((fifo2(S) = BFIFO1 @ (BIT1,BIT2,BFIFO2)
      and not(BIT1 = BIT2))
     implies ((BIT3 $\in$ BFIFO2 implies BIT2 = BIT3)
              and BIT2 = bit2(S))) .
```

Lemma Discovery (5)

```
eq inv10(S,BIT) = ((bit1(S) = bit2(S))
  implies (BIT $\in$ fifo2(S) implies BIT = bit2(S))) .
```

Dependence in Verification

The proof of inv_i uses inv_j as an induction hypothesis.
