i116: Basic of Programming

13. Programming language processor: virtual machine

Kazuhiro Ogata, Canh Minh Do

Roadmap

- Virtual machine for Minila

Virtual machine for Minila

- It does not suffice to handle a list of commands from the top to the bottom.
- It is necessary to have a command that deals with a condition so that **if** and **while** statements can be handled.
- It is also necessary to go (or jump) forward or backward to a position in such a list to this end.
- We may want to have a command that makes a program halt.

Virtual machine for Minila

- We add the following three new commands:
  - jmp(*n*)
  - cjmp(*n*)
  - quit

  where *n* is an integer.

  jmp stands for jump.

  cjmp stands for conditional jump.

Virtual machine for Minila

```
from enum import *
class CName(Enum):
    ....
    OR = auto()
    JMP = auto()
    CJMP = auto()
    QUIT = auto()
    NSC = auto()
```

```
def __str__(self):
    ...
    elif self == CName.OR:
        return 'or'
    elif self == CName.JMP:
        return 'jmp'
    elif self == CName.CJMP:
        return 'cjmp'
    elif self == CName.QUIT:
        return 'quit'
    ...
```

Adding three command names: JMP , CJMP and QUIT

Virtual machine for Minila

```
class Command(object):
    ...
    def __init__(self, cn, x):
        ...
        elif cn == CName.JMP:
            self.num = x
        elif cn == CName.CJMP:
            self.num = x
    def __str__(self):
        ...
        elif self.cname == CName.JMP:
            return str(self.cname) + '(' + str(self.num) + ')'
        elif self.cname == CName.CJMP:
            return str(self.cname) + '(' + str(self.num) + ')'
        else:
            return str(self.cname)
```

Adding three commands:
jmp(*n*), cjmp(*n*) and quit

Virtual machine for Minila

- Instead of handling commands from the top to the bottom in a list of command, we will use a program counter (*pc*) to decide what command will be handled next.
- *pc* is initially 0, referring to the top command in such a list.
- If quit is the command at the position referred to by *pc*, the VM quits and returns the environment.

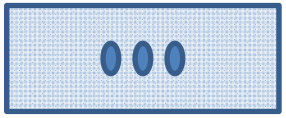
Virtual machine for Minila

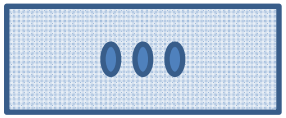
Command at *pc*

jmp(*n*)

pc ⟵ *pc*+*n*

Stack





Environment

{…}

{…}

Virtual machine for Minila

Command at *pc*

cjmp(*n*)

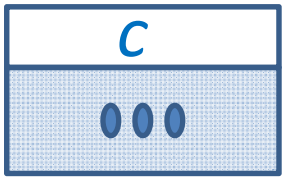
If *c* = 0

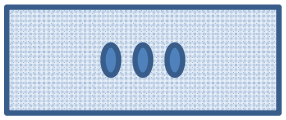
pc ⟵ *pc*+1

Otherwise

pc ⟵ *pc*+*n*

Stack





Environment

{...}

{...}

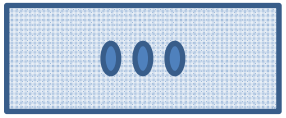
If Stack is empty, an exception called VMError is raised.

Virtual machine for Minila

Command at *pc*

quit

Stack



Environment

{...}

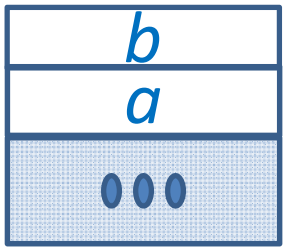
{...} is returned as the result

Virtual machine for Minila

Command at *pc*

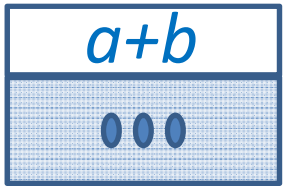
add

Stack



Environment

{…}



{…}

pc ⟵ *pc*+1

Virtual machine for Minila

Command at *pc*	Stack	Environment
store('x')		{…, 'x':*val'*, …} or {…}
pc ⟵ *pc*+1		{…, 'x':*val*, …}

Virtual machine for Minila

```
class VM(object):
    …
    self.pc = 0
    …
    def str(self):
        return 'pc: ' + str(self.pc) + ', stack: ' …
    def run(self):
        while True:
            if self.pc < 0 or self.pc >= len(self.clist):
                raise VMError('pc: ' + str(self.pc) + ' is out of scope of clist: ' + l2s(self.clist))
            com = self.clist[self.pc]
            if com.cname == CName.PUSH:
                self.stk = self.stk.push(com.num)
                self.pc = self.pc + 1
```

Virtual machine for Minila

```
elif com.cname == CName.LOAD:
    ...
    self.pc = self.pc + 1
elif com.cname == CName.STORE:
    ...
    self.pc = self.pc + 1
elif com.cname == CName.MONE:
    ...
    self.pc = self.pc + 1
elif com.cname == CName.MUL:
    ...
    self.pc = self.pc + 1
elif com.cname == CName.QUO:
    ...
    self.pc = self.pc + 1
```

Virtual machine for Minila

```
elif com.cname == CName.REM:
    ...
    self.pc = self.pc + 1
elif com.cname == CName.ADD:
    ...
    self.pc = self.pc + 1
elif com.cname == CName.SUB:
    ...
    self.pc = self.pc + 1
elif com.cname == CName.EQ:
    ...
    self.pc = self.pc + 1
elif com.cname == CName.NEQ:
    ...
    self.pc = self.pc + 1
```

Virtual machine for Minila

```
elif com.cname == CName.LT:
    ...
    self.pc = self.pc + 1
elif com.cname == CName.GT:
    ...
    self.pc = self.pc + 1
elif com.cname == CName.AND:
    ...
    self.pc = self.pc + 1
elif com.cname == CName.OR:
    ...
    self.pc = self.pc + 1
```

Virtual machine for Minila

```
elif com.cname == CName.JMP:
    self.pc = self.pc + com.num
elif com.cname == CName.CJMP:
    if self.stk.isEmpty():
        raise VMError('stk is empty for cjmp')
    x = self.stk.top()
    self.stk = self.stk.pop()
    if x == 0:
        self.pc = self.pc + 1
    else:
        self.pc = self.pc + com.num
elif com.cname == CName.QUIT:
    return self.env
else:
    raise VMError("An invalid command was met!")
```
