

Topic 1

The Triptych Paradigm

- The **prerequisite** for following this part of the lecture is that you have at least some introductory level programming skills, as, for example, obtained through a year of **Java** or **C#** programming.

- The **aims** are to introduce the basic ideas of
 - ★ *domain engineering*,
 - ★ *requirements engineering* and
 - ★ *software design*
 as they relate to one another, to introduce the concept of *separation of concerns* as represented here by the concepts of
 - ★ *phases*,
 - ★ *stages* and
 - ★ *steps*
 of development, and thus to introduce the concept of the *triptych software development process model*.

- The **objective** is to make the reader a professional software engineer with respect to understanding the crucial phases, stages and steps of software development.
- The **treatment** is precise but informal.

Delineations of Software Engineering "Old" Delineations

- The term "software engineering" seems to have many meanings.
- We shall bring in some of the characterisations that are given in previous textbooks as well as from elsewhere.

Friedrich L. Bauer 1968

Software engineering is the establishment and use of sound engineering principles in order to economically obtain software that is reliable and works efficiently on real machines.

So we are left to find out what is meant by engineering principles. These "engineering principles" cannot just be those of conventional engineering as we think that the engineering of software is radically different from other engineering. Conventional engineering builds on the laws of physics. Software engineering builds on mathematics, notably algebra and logic.

Ian Sommerville 1980-2000

Software engineering is an engineering discipline

- which is concerned with all aspects of software production
- from the early stages of system specification
- through to maintaining the system after it has gone into use.

In this definition, there are two key phrases:

- *Engineering discipline*:
 - ★ Engineers make things work.
 - ★ They apply theories, methods and tools where these are appropriate but they use them selectively and always try to discover solutions to problems even when there are no applicable theories and methods to support them.
 - ★ Engineers also recognise that they must work to organisational and financial constraints so they look for solutions within these constraints.

- *All aspects of software production*:
 - ★ Software engineering is not just concerned with
 - ◇ the technical processes of software development
 - ◇ but also with activities such as software project management
 - ◇ and with the development of tools, methods and theories to support software production.

We are getting some engineering principles unveiled, albeit of the conventional kind.

IEEE Std. 610.12-1990

The IEEE's Standard Glossary of Software Engineering Terminology:

Software engineering is defined as the application of a systematic, disciplined, quantifiable approach to the development, operation, and maintenance of software.

Again, a very conventional engineering characterisation.

David Lorge Parnas

Software engineering is defined as the multi-person construction of multi-version software.

This is, of course, not all that Parnas has to say about software engineering. As much of his other musings this one is cogent.

403-3236 Fax: +45 4450 3074 © Olsen Sjøgren, Frederik 11, DK-2840 Solrød, Denmark E-mail: dahl@immi.dtu.dk, sjogren@ipgnet.com, sjogren@ipgnet.dk URL: www.immi.dtu.dk/3k

Shari Lawrence Pfleeger, 2001

As software engineers, we use our knowledge of computers and computing to help solve problems . . . identification of problems and of when a computing solution may be appropriate, further analysis of such problems, and synthesis of solutions using method principles, techniques and tools, are ingredients of software engineering.

We are not getting much closer to our claimed difference between conventional engineering and software engineering. Pfleeger's characterisation is OK, but insufficient.

1.1.6 Carlo Ghezzi, Mehdi Jazayeri and Dino Mandrioli, 2002	April 5, 2006, 09:00	Page 12, Topic: 1, Foli: 12
home:/db/vollf/3sk1/3sk1-1		Richard Parnas Plank, DK-2800 Kong Lyngby, Denmark

Carlo Ghezzi, Mehdi Jazayeri and Dino Mandrioli, 2002

Software engineering is the field of computer science that deals with the building of software systems that are so large or so complex that they are built by a team or teams of engineers.

This definition hides the real content in its reference to computer (including computing) science, i.e., the mathematical discipline upon which the software engineers work. But, as for Parnas' characterisation, the Ghezzi/Jazayeri/Mandrioli characterisation emphasises scale.

Hans van Vliet

- *Software engineering concerns the construction of large programs.*
- *The central theme is mastering complexity.*
- *Software evolves.*
- *The efficiency with which software is developed is crucial.*
- *Regular co-operation between people is an integral part of programming-in-the-large.*
- *The software has to support its users effectively.*
- *Software engineering is a field in which members of one culture create artifacts on behalf of members of another culture.*

SOFTWARE ENGINEERING: Domains, Requirements and Software Design	Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
Our View: What Is Software Engineering?	April 5, 2006, 09:00	Page 15, Topic: 1, Foli: 15
home:/db/vollf/3sk1/3sk1-1		Richard Parnas Plank, DK-2800 Kong Lyngby, Denmark

Our View: What Is Software Engineering?

- We shall characterise the concept of 'software engineering' as follows:
 - ★ Software engineering is the establishment and use of sound methods for the efficient construction of efficient, correct, timely and pleasing software that solves the problems such as users identify them.
 - ★ Software engineering extends the field of computing science to include also the concerns of building of software systems that are so large or so complex that they necessarily are built by a team or teams of engineers.

403-3236 Fax: +45 4450 3074 © Olsen Sjøgren, Frederik 11, DK-2840 Solrød, Denmark E-mail: dahl@immi.dtu.dk, sjogren@ipgnet.com, sjogren@ipgnet.dk URL: www.immi.dtu.dk/3k

SOFTWARE ENGINEERING: Domains, Requirements and Software Design	Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
1.2 Our View: What Is Software Engineering?	April 5, 2006, 09:00	Page 16, Topic: 1, Foli: 16
home:/db/vollf/3sk1/3sk1-1		Richard Parnas Plank, DK-2800 Kong Lyngby, Denmark

- ★ Software engineering is the profession in which a knowledge of mathematics, gained by study, experience and practice, is applied, with judgment to develop ways of exploiting mathematics to (i) understand the problem domain, (ii) the problem and (iii) to develop computing systems, especially software solutions, to such problems as are conveniently solved by computing.
- ★ Software engineering thus consists of (i) domain engineering (in order to understand the problem domain), (ii) requirements engineering (in order to understand the problem and possible frameworks for their solution) and (iii) software design (in order to actually implement desired solutions).

403-3236 Fax: +45 4450 3074 © Olsen Sjøgren, Frederik 11, DK-2840 Solrød, Denmark E-mail: dahl@immi.dtu.dk, sjogren@ipgnet.com, sjogren@ipgnet.dk URL: www.immi.dtu.dk/3k

● In the next part of the lecture we shall examine these three concepts:

- ★ domain engineering,
- ★ requirements engineering and
- ★ software design.

Topic 2

The Triptych of Software Engineering

Theme of this Lecture

- Before some specific software can be designed and coded,
- we must understand the requirements
- that this software must fulfill.

- Before requirements can be written down,
- we must understand the application domain
- for which the software is to be developed.

- So, from descriptions of the application domain
 - ★ we construct prescriptions of the requirements;
- and from prescriptions of the requirements
 - ★ we design the software.

- Ideally speaking we would wish to proceed from
 - ★ describing the application domain,
 - ★ via prescribing the requirements,
 - ★ to implementing the software.
- Actual life sometimes forces us,
 - ★ and always permits us,
 - ★ to iterate between these three phases of software development.

On Universes of Discourse and Domains

- Above we have used the term “application domain” without explaining what we mean by that term.
- We shall now explain that term as well as the more general term ‘universe of discourse’ and the simpler term ‘domain’.

Characterisation 1.1 By a *universe of discourse* we shall understand anything that can be spoken about. ■

Example 1.1 *Universes of Discourse*: We shall take the view here that there are basically three classes of universes of discourse:

- The definite, but singleton class of software engineering as an intellectual concept, i.e., software development in general and programming in particular.
 - ★ So, domain engineering, requirements engineering and software design could each, or as a whole, be a universe of discourse.
 - ★ These lectures take this intellectual concept of software engineering as its universe of discourse.
 - ★ As an intellectual concept the software engineering universe of discourse is not an application domain.

- The indefinite class of “things” to which computing may be applied, i.e., application domains (see next).
- The infinite class of anything else that does not satisfy the above characterisations. Examples are: philosophy, politics, poetry, etc. ■

Characterisation 1.2 By an *application domain* we shall understand anything to which computing may be applied. ■

The reader may observe two things: Our inability to make precise that to which computing cannot be applied, and our belief that philosophy, politics, poetry, etc., belong to that class. When we claim that computing does not apply to philosophy, politics, poetry, etc., we mean that crucial philosophical thoughts, political ideas and poetic utterings cannot, in our mind, be the result of computation.

Example 1.2 *Application Domains*: We shall take the view that there are basically three classes of application domains:

- The class of applications which can be characterised as supporting the teaching or study of a subject field: educational or training software, respectively experimental software for theorem proving, or the like.

SOFTWARE ENGINEERING: Domains, Requirements and Software Design		Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
On Universes of Discourse and Domains		Page 25, Topic: 2, Foli: 8	Richard Piresen Platz, DK-2800 Kong Lyngby, Denmark
home:/db/vollf/3ch1/3ch1-i-i	April 5, 2006, 09:00		

- The class of applications which can be characterised as supporting the development of computing systems themselves: compilers, operating systems, database management systems, data communication systems, etc.
- And the class of applications which can be characterised as not supporting the development of computing systems themselves, but that of business, or industry software.

Characterisation 1.3 By a *domain* we mean an application domain.

That is, the two terms “application domain” and “domain” are taken to be synonymous.

SOFTWARE ENGINEERING: Domains, Requirements and Software Design		Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
2.1 On Universes of Discourse and Domains		Page 26, Topic: 2, Foli: 9	Richard Piresen Platz, DK-2800 Kong Lyngby, Denmark
home:/db/vollf/3ch1/3ch1-i-i	April 5, 2006, 09:00		

Example 1.3 Domains: We continue our exemplification of (application) domains — of the third class mentioned just above.

- The applications of software within the transportation sector: Railways, airlines, shipping, public and private road transport (buses, taxis, trucks, automobiles in general), etc., individually define application domains, and together “define” *transportation* as a domain.

¹Here our use of “define” indicates that we are not formally defining the subject term. We are merely giving a rough characterisation.

SOFTWARE ENGINEERING: Domains, Requirements and Software Design		Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
On Universes of Discourse and Domains		Page 27, Topic: 2, Foli: 10	Richard Piresen Platz, DK-2800 Kong Lyngby, Denmark
home:/db/vollf/3ch1/3ch1-i-i	April 5, 2006, 09:00		

- The applications of software within the financial services sector: banks, insurance companies, securities trading (stock and bond exchanges, traders, brokers), portfolio and investment management, venture capital companies, etc., individually define application domains, and together “define” the *financial service industry* as a domain.

SOFTWARE ENGINEERING: Domains, Requirements and Software Design		Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark

home:/db/vollf/3ch1/3ch1-i-i	April 5, 2006, 09:00		

- The applications of software within the healthcare sector: hospitals, family doctors (i.e., private, practicing physician), pharmacies, community nurses, retraining and convalescent clinics, the public health authorities, etc., individually define application domains, and together “define” *healthcare* as a domain.

SOFTWARE ENGINEERING: Domains, Requirements and Software Design		Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark

home:/db/vollf/3ch1/3ch1-i-i	April 5, 2006, 09:00		

- The applications of software within the machining (metal-working) manufacturing sector individually define application domains, and together “define” *machining (metal-working) manufacturing* as a domain.

SOFTWARE ENGINEERING: Domains, Requirements and Software Design		Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
2.1.1 General		Page 30, Topic: 3, Foli: 1	Richard Piresen Platz, DK-2800 Kong Lyngby, Denmark
home:/db/vollf/3ch1/3ch1-i-i-d	April 5, 2006, 09:00		

Topic 3
Domain Engineering
General

- We shall give a brief characterisation of what we mean by domain engineering.

Characterisation 1.4 (I) By a *domain description* we shall understand a description of a domain, that is, something which describes observable phenomena of the domain: entities, functions over these, events and behaviours.

SOFTWARE ENGINEERING: Domains, Requirements and Software Design		Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
1 General		Page 31, Topic: 3, Foli: 2	Richard Piresen Platz, DK-2800 Kong Lyngby, Denmark
home:/db/vollf/3ch1/3ch1-i-i-d	April 5, 2006, 09:00		

Characterisation 1.5 (II) By *domain description* we shall also mean the process of domain capture, analysis and synthesis, and the document which results from that process.

Characterisation 1.6 By *domain engineering* we mean the engineering of domain descriptions, that is, of their development: (i) from domain capture and analysis (ii) via synthesis, i.e., the domain description document itself, (iii) to its validation with stakeholders and its possible theory development.

SOFTWARE ENGINEERING: Domains, Requirements and Software Design		Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
2.1.1 General		Page 32, Topic: 3, Foli: 3	Richard Piresen Platz, DK-2800 Kong Lyngby, Denmark
home:/db/vollf/3ch1/3ch1-i-i-d	April 5, 2006, 09:00		

- So what does it mean to understand the application domain?
- To us it means that we have described it.
- That the description is consistent, i.e.,
 - ★ does not give rise to contradictions,
- and that the description is relatively complete, i.e.,
 - ★ does describe “all the things” needed to be described.

What Do We Expect from a Domain Description?

- What must we expect from a domain description?
- We expect
 - ★ that it describes the application area *as it is*.

What a Domain Description Does Not Describe

- To us “as it is” means
 - ★ that we have described it without any reference to requirements to any new computing system (i.e., software),
 - ★ let alone to any (implementation, etc.) of such a new computing system (i.e., software).
- The above was expressed in terms of *what a domain description does not contain*.

What a Domain Description Does Describe

- So what does a domain description contain?
- To us a domain description contains:
 - ★ descriptions of the *phenomena* that can be observed, that can be physically sensed, in the domain, and
 - ★ descriptions of the *concepts*, i.e., the abstractions that these phenomena “embody”.

Domain Phenomena and Concepts

- What are the phenomena and concepts alluded to just above?
- To us these phenomena and concepts are such as:
 - ★ entities,
 - ★ functions,
 - ★ events and
 - ★ behaviours.
- We overview these four categories of phenomena and concepts.

• Entities

- Entities are “things” that one can point to,
- things that typically become data “inside” a computer,
- things that are to have a *type*
- and a *value* (of that type).

Example 1.4 Entities: For a domain of harbours some typical entities are:

- ships,
- holding area(s) where ships may wait for a buoy or a quay position,
- buoys,
- quay positions and
- cargo storage areas.
- The harbour can be considered an entity composed from the above.

- We shall later explain the notation now used:

type

Harbour, Ship, HoldArea, Buoy, Quay, CSA, Position

value

- obs.Ships: Harbour → Ship-**set**
- obs.HoldAreas: Harbour → HoldArea-**set**
- obs.Buoys: Harbour → Buoy-**set**
- obs.Quays: Harbour → Quay-**set**
- obs.CSAs: Harbour → CSA-**set**
- obs.Position: Ship → Position-**set**
- obs.Position: Quay → Position-**set**
- obs.Position: Buoy → Position-**set**
- obs.Position: HoldArea → Position-**set**

- From a harbour one can observe all the
 - ★ ships in the harbour,
 - ★ holding areas of the harbour,
 - ★ buoys of the harbour,
 - ★ quay positions of the harbour and all the
 - ★ container storage areas of the harbour.
- Positions are associated with
 - ★ ships,
 - ★ holding areas,
 - ★ buoys and
 - ★ quays.

SOFTWARE ENGINEERING: Domains, Requirements and Software Design	Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
3 Domain Phenomena and Concepts	April 5, 2006, 09:00	Page 41, Topic: 3, Foli: 12
home:/db/vollf/3ch1/3ch1-i-d		Richard Parnow Plank, DK-2800 Kong Lyngby, Denmark

We sketch and explain the following formal text:

type
A, B, C, ..., P, Q, R, ...

value
a:A,

obs_B: $A \rightarrow B$
obs_C: $B \rightarrow C$
...

obs_Ps: $B \rightarrow P\text{-set}$
obs_Ql: $C \rightarrow Q^*$

The lecturer explains the above.

2.2.5 Domain Phenomena and Concepts	April 5, 2006, 09:00	Page 42, Topic: 3, Foli: 13
home:/db/vollf/3ch1/3ch1-i-d		Richard Parnow Plank, DK-2800 Kong Lyngby, Denmark

• Functions

- Phenomena or concepts could be
- *functions* that apply to entities and
 - ★ either test for some property,
 - ★ observe some subentity, i.e., yield a data value that is “computed” from such entities, or
 - ★ actually change the entity value — in which case we call the function an operation, or an action.

4435 3726, Fax: +45 4450 8874 © Olsen Egner, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.dk, sjtu@informatics.imm.sjtu.dk, www.imm.sjtu.dk/44

SOFTWARE ENGINEERING: Domains, Requirements and Software Design	Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
3 Domain Phenomena and Concepts	April 5, 2006, 09:00	Page 43, Topic: 3, Foli: 14
home:/db/vollf/3ch1/3ch1-i-d		Richard Parnow Plank, DK-2800 Kong Lyngby, Denmark

Example 1.5 Functions: For a domain of harbours some typical functions are:

(i) An arriving ship asks the harbour whether it can be allocated either a holding area, a buoy or a quay position.
value: inquire: $Ship \times Harbour \rightarrow Bool$

(ii).1 An arriving ship which can be allocated a holding area, a buoy, or a quay position requests the position.
value: request: $Ship \times Harbour \rightarrow Position$

4435 3726, Fax: +45 4450 8874 © Olsen Egner, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.dk, sjtu@informatics.imm.sjtu.dk, www.imm.sjtu.dk/44

home:/db/vollf/3ch1/3ch1-i-d		Richard Parnow Plank, DK-2800 Kong Lyngby, Denmark

We define three *sorts*, i.e., *abstract types*, and give the *signature* of four functions:

type
(0) A, B, C

value
(1) inv_A: $A \rightarrow Bool$
(2) obs_B: $A \rightarrow B$
(3) gen_C: $B \rightarrow C$
(4) chg_B: $A \times B \rightarrow B$

4435 3726, Fax: +45 4450 8874 © Olsen Egner, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.dk, sjtu@informatics.imm.sjtu.dk, www.imm.sjtu.dk/44

SOFTWARE ENGINEERING: Domains, Requirements and Software Design	Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
2.2.5 Domain Phenomena and Concepts	April 5, 2006, 09:00	Page 46, Topic: 3, Foli: 17
home:/db/vollf/3ch1/3ch1-i-d		Richard Parnow Plank, DK-2800 Kong Lyngby, Denmark

- (0) A, B and C are sorts, i.e., further unspecified abstract types.
- (1) *inv_A* is a predicate: it is supposed to yield **true** for well-formed values of A, **false** otherwise.
- (2) *obs_B* is intended as an observer function: from values *a* of sort A it observes, i.e., extracts, values of type B that are somehow “contained” in *a*.
- (3) *gen_C* is intended as a generator function: from values of sort B it computes values of type C.

4435 3726, Fax: +45 4450 8874 © Olsen Egner, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.dk, sjtu@informatics.imm.sjtu.dk, www.imm.sjtu.dk/44

SOFTWARE ENGINEERING: Domains, Requirements and Software Design	Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
3 Domain Phenomena and Concepts	April 5, 2006, 09:00	Page 47, Topic: 3, Foli: 18
home:/db/vollf/3ch1/3ch1-i-d		Richard Parnow Plank, DK-2800 Kong Lyngby, Denmark

- (4) *chg_B* is intended as an operation (i.e., a generator function): from Cartesian values over A and B it generates values of type B intended to replace the argument of type B. One might thus write any of the below:
 - [5] **variable** b:B := ...; ... b:=chg_B(a,b) ...
 - [6] **let** b:=chg_B(a,b) **in** ...; b:=b; ... **end**
 - [7] **let** b:=chg_B(a,b) **in** ... gen_C(b) ... **end**

Example 1.6 The A, B, Cs of Ships and Harbours: The reader is asked to complete this example, that is, to relate the types and functions of Example 1.5 to the sorts and functions of the box above!

4435 3726, Fax: +45 4450 8874 © Olsen Egner, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.dk, sjtu@informatics.imm.sjtu.dk, www.imm.sjtu.dk/44

• Events

- Events happen, i.e., occur. And when events occur they do so instantaneously.
- Events may convey information, i.e., have significance other than just occurring.
- We can speak of external events and of internal events.

Example 1.7 Events: For a domain of harbours some typical events are:

- a ship arrives at a harbour;
- a ship declares itself ready to unload or to load;
- a ship and a quay engage in the events of unloading and loading;
- a ship declares itself ready to depart a holding area, or a buoy or a quay position.

channel

sh,hs:MSG
 sqr:ArrDep
 sq,qs:Cargo

value

ship(...) ≡
 ... sh!mkArrive(si,sc) ... let pos = hs? ... end ...
 ... sqr!ready ... sq!c ... let c = qs? ... end ...
 harbour(...) ≡
 ... let mkArrive(s,c) = sh? ... hs!mkQuay(q) ... end
 quay(...) ≡
 ... if sqr?=ready then let c = sq? ... qs!c' ... end else ... end

We sketch and explain the following specification text:

type M
 channel $t_p, t_q : \text{Bool}, k : M$

value
 P() ≡
 p:while $t_p?$ do
 action_p1;
 k ! v
 action_p3
 end

Q() ≡
 variable w:M;
 q:while $t_q?$ do
 action_q1;
 v := k ? in
 action_q3
 end

R() ≡ P() || Q()

- External events occur in an outside environment, “around” the part of the domain being considered — i.e., interfacing with it — and are being communicated to that part. Or external events occur within the domain being considered, and are being communicated to “somewhere” outside the part of the domain being considered.
- Internal events occur in one part of the domain being considered and are destined for, i.e., communicated to, another part of the domain being considered — in which case we consider those parts as belonging to different behaviours.

In RSL we may model events in terms of RSL/CSP inputs/outputs:

type
 ShipId, ShChar, HAPos, BuoyPos, QuayPos
 MSG == mkArrive(shid:ShipId,shchar:ShChar)
 | mkHoldArea(p:Pos)
 | mkBuoy(b:BuoyPos)
 | mkQuay(q:QuayPos) | ...
 ArrDep == ready | depart
 Cargo

• Behaviours

- Some *phenomena* (or *concepts*) are thought of as *behaviours*. They proceed, typically in time, by
 - ★ performing functions (actions),
 - ★ generating or responding to *events*
 - ★ and otherwise *interacting* (i.e., *synchronising* and *communicating*) with other behaviours.

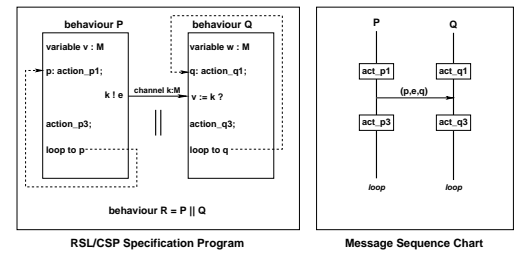

Figure 1.1: Informal process diagrams

SOFTWARE ENGINEERING: Domains, Requirements and Software Design	Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark Richard Petersen Plaza, DK-2800 Kong Lyngby, Denmark
3 Domain Phenomena and Concepts	April 5, 2006, 09:00	Page 57, Topic: 3, Foli: 28
<p>• If channels are nonpersistent, i.e., are 0-capacity buffers, then we say that the fact that the computation based on behaviour P does not proceed to its next action before the computation based on behaviour Q has consumed the message (sent by Q) constitutes a <i>synchronisation</i>.</p> <p>• In either case, the message being transferred constitutes a <i>communication</i>.</p> <p>• We shall usually use the term behaviour in favour of process.</p> <p>• However, when a behaviour (or rather, a set of behaviours) is implemented by (i.e., exists inside) the computer, we shall also call it a <i>process</i>.</p> <p>To the right in Fig. 1.1 we have shown an MSC (message sequence chart). The <i>loop</i> annotation is strictly speaking outside the proper MSC syntax. We refer to Vol. 1, Chap. 21 for a thorough coverage of CSP and RSL/CSP. And we refer to Vol. 2, Chap. 13 for a thorough coverage of MSC.</p>

- We shall treat the concepts of phenomena and concepts in a later lecture.
- Suffice it for now to justify the above remarks as follows.
 - ★ Entities typically are manifest; that is, they exist in time and space.
 - ★ Functions can be conceived through their effects, but cannot, in and by themselves, be observed.
 - ◊ *Nobody has ever seen the number which we may represent by any of the numerals 7, vii, seven, IIIIIII, III, etc.*
 - ★ Even more so for behaviours: we may observe a progression of changing entities, effects of function applications and events; but we cannot “see” the behaviour, only conceive of it!
 - ★ The same is true for events.

home:/db/vollf/3ch1/3ch1-i-d	April 5, 2006, 09:00		

Further Expectations from Domain Descriptions

- What else must we expect from a domain description?
- Although we shall review domain engineering in in the next lecture, and treat domain engineering in detail in later lectures we shall just mention a few things.
 - ★ We expect a domain description to be readable and understandable by all stakeholders of the domain, i.e., by all those people who “populate” the domain.
 - ★ We expect a domain description to be the basis for learning about the domain, that is, for education about and training in the domain — say, for such people as are being hired into a job in the domain, or for such people that need services offered by the domain.

home:/db/vollf/3ch1/3ch1-i-d	April 5, 2006, 09:00		

- ★ We expect a domain description to be the basis for constructing a major part of the requirements, namely that part which we shall call the *domain requirements*.
- ★ And we expect a domain description to be a basis for what — in other contexts than software engineering — is known as *business process reengineering*.

Domain Descriptions as Bases for Domain Theories

- Physicists have spent the last 400 years studying nature.
- Traditional engineering disciplines, such as
 - ★ civil engineering,
 - ★ mechanical engineering,
 - ★ chemical engineering,
 - ★ electrical engineering, and
 - ★ electronics engineering,
- all build on various theories of physics and chemistry.

403-2726 Fax: +45 4450 3074 © Olsen Egner, Fønsting 11, DK-2800 Møln, Denmark E-mail: d@iim.dtu.dk, i@imr@iimr.dtu.dk, j@imr@iimr.dtu.dk, www.imr.dtu.dk

7 Domain Descriptions as Bases for Domain Theories		Page 71, Topic: 3, Foli: 42	Richard Preuss, Peter Dink, 2000 Kgl. Lyngby, Denmark
home:/db/vollf/3ch1/3ch1-i-d	April 5, 2006, 09:00		

- The engineering artifacts, that such engineers build, embody, so-to-speak, fragments of these theories.
- For the class of application domains that was characterised as being
 - ★ end-user,
 - ★ public administration and institution oriented,
 - ★ as well as business and industry oriented,
- for that class of human-made universes of discourse we cannot refer to any such similar theories!

403-2726 Fax: +45 4450 3074 © Olsen Egner, Fønsting 11, DK-2800 Møln, Denmark E-mail: d@iim.dtu.dk, i@imr@iimr.dtu.dk, j@imr@iimr.dtu.dk, www.imr.dtu.dk

home:/db/vollf/3ch1/3ch1-i-d	April 5, 2006, 09:00		

- Isn't it about time that we develop theories, such as physicists have done, for respective application domains?
- This author thinks so.
- With the principles and techniques of domain engineering the student will be well prepared to help contribute research and development on such a theory.
- But to do it properly, the student needs to learn additional principles, formal techniques and related tools.

More on Domain Engineering

- We have briefly previewed some domain concepts,
- there are many more.
- For domain engineers
 - ★ to know how to proceed, what to do,
 - ★ and how to do it, and do it professionally, with assurance,
 it is important that they know
 - ★ what domain engineering entails.
- In particular they must know
 - ★ what should be, and not be, in a domain description document,
 - ★ that is, its parts and structure.

Topic 4
Requirements Engineering

- In this lecture we shall give a brief characterisation of what we mean by requirements engineering.

4035 2726 Fax: +45 4450 3074 © Olsen Eggen, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.edu.cn, d@informatics.imm.sjtu.edu.cn, www.imm.sjtu.edu.cn

1 The Machine		Page 75, Topic: 4, Fall: 2	Richard Persson Plank, DK-2800 Kong Lyngby, Denmark
home:/db/vollf/3ch1/3ch1-1.r	April 5, 2006, 09:00		

The Machine

- We introduce the term machine.

Characterisation 1.7 By *machine* we shall understand a combination of hardware and software that is the target for, or result of, computing systems development.

- The objective of writing down requirements is to prescribe desired properties of a machine:
- the software and the hardware on which the software resides.

4035 2726 Fax: +45 4450 3074 © Olsen Eggen, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.edu.cn, d@informatics.imm.sjtu.edu.cn, www.imm.sjtu.edu.cn

2.3.2 The Machine Environment		Page 76, Topic: 4, Fall: 3	Richard Persson Plank, DK-2800 Kong Lyngby, Denmark
home:/db/vollf/3ch1/3ch1-2.r	April 5, 2006, 09:00		

The Machine Environment

- We introduce the concept of the environment of a machine.

Characterisation 1.8 By *machine environment* we shall understand the rest of the world. More specifically, we mean

- those parts of the world which interface to the machine:
- its users, whether humans or technology

• So the objective of writing down requirements is also to delineate,

- to decide upon and distinguish between
 - ★ what is to “belong” to the machine, and
 - ★ what is to “belong” to the environment.

4035 2726 Fax: +45 4450 3074 © Olsen Eggen, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.edu.cn, d@informatics.imm.sjtu.edu.cn, www.imm.sjtu.edu.cn

3 General		Page 77, Topic: 4, Fall: 4	Richard Persson Plank, DK-2800 Kong Lyngby, Denmark
home:/db/vollf/3ch1/3ch1-3.r	April 5, 2006, 09:00		

General

Characterisation 1.9 By *requirements* we mean a document which prescribes desired properties of a machine: *what* the machine shall (must, not should) offer of functions and behaviours, and what entities it shall maintain.

Characterisation 1.10 By a *requirements prescription* we mean the process — and the document which results from the process — of requirements capture, analysis and synthesis.

4035 2726 Fax: +45 4450 3074 © Olsen Eggen, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.edu.cn, d@informatics.imm.sjtu.edu.cn, www.imm.sjtu.edu.cn

SOFTWARE ENGINEERING: Domains, Requirements and Software Design		Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
2.3.3 General		Page 78, Topic: 4, Fall: 5	Richard Persson Plank, DK-2800 Kong Lyngby, Denmark
home:/db/vollf/3ch1/3ch1-3.r	April 5, 2006, 09:00		

Characterisation 1.11 By *requirements engineering* we understand the engineering, that is, we understand the development of requirements prescriptions: from requirements prescription via the analysis of the requirements document itself, its validation with stakeholders and its possible theory development.

4035 2726 Fax: +45 4450 3074 © Olsen Eggen, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.edu.cn, d@informatics.imm.sjtu.edu.cn, www.imm.sjtu.edu.cn

4 Different Kinds of Requirements		Page 79, Topic: 4, Fall: 6	Richard Persson Plank, DK-2800 Kong Lyngby, Denmark
home:/db/vollf/3ch1/3ch1-4.r	April 5, 2006, 09:00		

Different Kinds of Requirements

- We see four different kinds of requirements:
 - ★ *business process reengineering*,
 - ★ *domain requirements*,
 - ★ *interface requirements*, and
 - ★ *machine requirements*.

4035 2726 Fax: +45 4450 3074 © Olsen Eggen, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.edu.cn, d@informatics.imm.sjtu.edu.cn, www.imm.sjtu.edu.cn

home:/db/vollf/3ch1/3ch1-4.r	April 5, 2006, 09:00		

- Conventionally the following terms are in circulation:
 - ★ *systems requirements*, which approximately covers our overall requirements,
 - ★ *user requirements*, which approximately covers our domain and interface requirements,
 - ★ *functional requirements*, which approximately covers our domain and interface requirements and
 - ★ *non-functional requirements*: approximately covers our machine requirements.

4035 2726 Fax: +45 4450 3074 © Olsen Eggen, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.edu.cn, d@informatics.imm.sjtu.edu.cn, www.imm.sjtu.edu.cn

More on Requirements Engineering

- We have briefly previewed some requirements concepts.
- There are many more.
- For the requirements engineer
 - ★ to know how to proceed, what to do,
 - ★ and how to do it, and do it professionally, with assurance,
 it is important that that engineer knows
 - ★ what requirements engineering entails, in particular:
 - ★ what should be, and not be, in a requirements prescription document: its parts and structure.

Topic 5 Software

Characterisation 1.12 By *software* we understand

- not only *code* that may be the basis for executions by a computer,
- but also its full *development documentation*:
 - ★ the stages and steps of *application domain description*,
 - ★ the stages and steps of *requirements prescription*,
 - ★ and the stages and steps of *software design* prior to code,
 with all of the above including all *validation* and *verification* (including *test*) *documents*.

- In addition, as part of our wider concept of software, we also include
- a comprehensive collection of *supporting documents*:
 - ★ *training manuals*,
 - ★ *installation manuals*,
 - ★ *user manuals*,
 - ★ *maintenance manuals*, and
 - ★ *development* and *maintenance logbooks*.

So, software, as documentation, comprises many parts. ■

Software Design

From an understanding of what software syntactically, i.e., as documents, “is”, we can go on to characterise pragmatic and semantic aspects related to software.

Characterisation 1.13 By *software design* we understand

- the process,
- as well as all the documents resulting from the process,
- of turning requirements into executable code (and appropriate hardware)

- We make a distinction between two kinds of abstract software specifications, and hence their designs:
 - ★ the software architecture,
 - ★ and the component structure.
- After a brief presentation of these we shall comment on their nature.

Software Architecture and Software Architecture Design

Characterisation 1.14 By a *software architecture* we mean a first specification of software, after requirements,

- that indicates *how* the software is to handle the given requirements
- in terms of components and their interconnection —
- though without detailing, i.e., designing these components

Characterisation 1.15 By a *software architecture design* we mean the development process of going

- from existing requirements
 - and possibly some already designed components
 - to the software architecture —
- producing all appropriate architecture documentation. ■

Component Structure and Component Design

Characterisation 1.16 By a *component structure* we mean

- a second kind of specification of software — after requirements and software architecture —
- one which indicates *how* the software is to implement individual components and modules

Characterisation 1.17 By *component design* (I) we mean the development process of going

- from existing requirements and a software architecture design
- to the detailed component modularisation — producing all appropriate component and module documentation. ■

Software Architecture Versus Component + Module Structure

- We are not saying that
 - ★ one must first design the software architecture,
 - ★ and thereafter the component plus module structure.
- We are presently leaving their order of development — and one of the two, or even a “mix” of them — unexplained!

Modules, Components and Systems

- The principle of grouping programming text into modules
- and collections of modules into components
- is both old (for modules since the late 1960s, e.g., Simula 67),
- and new (for components since the early 1990s).

Characterisation 1.18 By a *module specification* we shall understand a syntactic construct, i.e., a structure of program text, which, as a unit of program text, defines what we shall otherwise also call an *abstract data type*: namely a collection of data values and a collection of functions (i.e., operations) over these. ■

Discussion 1.1 So, by an *abstract data type*, i.e., a *module* we mean a set of data values and a set of procedures (routines) that apply to such data values and yield such data values. Typically *module specifications* are of the following schematic form:

```

module m:
types
    t1 = te1, t2 = te2, ..., tt = tet;
variables
    v1 type ta := ea, v2 type tb := eb, ..., vv type tc := ec
functions
    f1: ti → tj, f1(ai) ≡ C1(ai)
    f2: tk → tℓ, f2(ak) ≡ C2(ak)
    ...
    fn: tp → tq, fn(ap) ≡ C1(ap)
hide: fi, fj, ..., fk
end module
    
```

Syntax, semantics and pragmatics: Lecturer to explain. ■

Characterisation 1.19 By a *component specification* we shall usually understand

- a set of type definitions,
- a set of component local variable declarations,
- together defining a component local state,
- and a set of modules

The above is just a rough, generic characterisation of components. ■

Discussion 1.2 The idea is

- that a *component specification* to some surrounding text offers functions of some of its modules.
- The surrounding text may consist of modules, what we call *initial modules* of a *software system*. ■

- We may suggest a syntax for components:

```

component
types:  $\mathcal{T}_{i_1}, \mathcal{T}_{i_2}, \dots, \mathcal{T}_{i_t}$ 
variables:  $\mathcal{V}_{j_1}, \mathcal{V}_{j_2}, \dots, \mathcal{V}_{j_v}$ 
modules:  $\mathcal{M}_{k_1}, \mathcal{M}_{k_2}, \dots, \mathcal{M}_{k_m}$ 
hide:  $\mathcal{H}_{\ell_1}, \mathcal{H}_{\ell_2}, \dots, \mathcal{H}_{\ell_h}$ 
end component
    
```

- \mathcal{T}_i suggests some form of type definitions,
- \mathcal{V}_j suggests some form of variable declarations,
- \mathcal{M}_k suggests some form of module specifications, and
- \mathcal{H}_ℓ suggests some form of export or hiding of module visible functions (etc.).

SOFTWARE ENGINEERING: Domains, Requirements and Software Design		Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
3 Systems, Design and Refinement		Page 97, Topic: 5, Foli: 16	Richard Parnass Plank, DK-2800 Kong Lyngby, Denmark

Systems, Design and Refinement

Characterisation 1.20 By a *software system specification* we shall understand

- a set of what we shall call *initial* modules
- together with a set of components —
- and such that functions of the set of initial modules together invoke functions of modules in the set of components.

Systems are what we are developing. ■

4035 3726, Fax: +45 4450 3074 © Olsen Eggen, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.net@gmail.com, d@informatics.imm.sjtu.net, www.imm.sjtu.net/4035

home:/db/vufile/3ch1/3ch1-i-i-a		April 5, 2006, 09:00	

Discussion 1.3 The idea is that a *system*

- is a completely self-contained “item” of software,
- and that it is composed from components and the *core*, that is, the initial modules.

The idea is also

- that a most abstract level system may be the same as a software architecture,
- or a component plus initial module structure.

■

home:/db/vufile/3ch1/3ch1-i-i-a		April 5, 2006, 09:00	

Characterisation 1.21 By *software system design* we understand

- the determination,
 - ★ from domain requirements and from some interface requirements, of the software architecture, or
 - ★ from machine requirements and from other interface requirements, of the component structuring plus initial modules.

Since software architecture design also entails determination of component structuring plus initial modules, we get, more generally, that software system design, in its first stage, i.e., where only the domain description and the requirements prescription exists, entails

■

4035 3726, Fax: +45 4450 3074 © Olsen Eggen, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.net@gmail.com, d@informatics.imm.sjtu.net, www.imm.sjtu.net/4035

home:/db/vufile/3ch1/3ch1-i-i-a		April 5, 2006, 09:00	

- the determination of the main (system) types of values,
- the determination of the basic structuring of and facilities (i.e., functions) offered by components, and
- the determination of such initial modules as are necessary to get the system executing once it is committed

■

- Usually a first stage of systems design is expressed abstractly,
- i.e., in a form not suited as a prescription for execution.
- Hence we need stages and steps of what is called *refinement*:

■

4035 3726, Fax: +45 4450 3074 © Olsen Eggen, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.net@gmail.com, d@informatics.imm.sjtu.net, www.imm.sjtu.net/4035

home:/db/vufile/3ch1/3ch1-i-i-a		April 5, 2006, 09:00	

Characterisation 1.22 By *software system refinement* we understand

- the stagewise and stepwise transformation of
 - ★ an abstract specification
 - ★ into increasingly more concretely specified modules and components

■

4035 3726, Fax: +45 4450 3074 © Olsen Eggen, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.net@gmail.com, d@informatics.imm.sjtu.net, www.imm.sjtu.net/4035

Components and Modules, Design and Refinement

Characterisation 1.25 By *component design* (II) we shall additionally understand

- the determination of which facilities,
 - ★ that is, which functions (defined locally “within” the component),
 - ★ and which types (defined globally, i.e., “outside”),
- the component shall offer.
- We shall also, by component design roughly speaking mean,
 - ★ the decomposition of the component into modules,
 - ★ and hence, the functions offered by these modules

■

4035 3726, Fax: +45 4450 3074 © Olsen Eggen, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.net@gmail.com, d@informatics.imm.sjtu.net, www.imm.sjtu.net/4035

- One cannot expect a first attempt at component design to succeed in finalising all aspects of an efficient implementation.
- As will be argued in the next lecture, separation of concerns makes it easier to tackle many diverse issues.
- Hence our development needs to proceed in stages and steps of refinement.

■

Topic 6

Phases, Stages and Steps of Development

Three Terms

- The terms phase, stage, and step, are just that: terms.
- They are meant to designate basically the same idea:
 - ★ the decomposition of something occurring in time
 - ★ into adjacent, repeated or concurrent intervals.
- The “something” here is the development of software.
- The adjacent, concurrent or overlapping intervals
- are logically and otherwise distinguishable development activities.

A Principle of “Separation of Concerns”

- The main reason for decomposing the *software development process* into clearly distinguishable development activities
 - ★ is to tackle separate development issues
 - ★ at separate times,
 - ★ hopefully scheduling these in adjacent, concurrent or overlapping intervals
 - ★ in a fruitful, beneficial way.
- In the next parts of the lecture we shall briefly review possible decompositions.
- Each represent a concern; together they represent *separation of concerns*.

Linear, Cyclic and Parallel Development Activities

- In the next lecture parts we shall present a view of the software development process as proceeding in strict linear order.
- Given human nature, such is rarely the case.
- At the end of this lecture we shall therefore present two additional views on the software development process:
 - ★ one in which iterations, backwards and forwards, are discussed;
 - ★ and one in which the concurrent tackling of logically separate stages or steps is discussed.

- By a repeated, or cyclic, interval we mean two intervals, occurring in non-overlapping time periods, in which basically the same item of work is done, i.e., repeated, for example, because a first iteration was not good enough.
- By concurrent or overlapping intervals we mean two (or more) intervals, in which clearly unrelated work items can be done, independently of one another, hence in parallel.

Phases of Software Development

- We have already introduced the main three phases of software development:
 - ★ domain development,
 - ★ requirements development, and
 - ★ software design.
- We have earlier argued for their distinctness, i.e., their focus on truly separate concerns,
- but we have also emphasised their desirable order, namely as listed.

Stages and Steps of Development

- In order to capture a notion of development stage it is important to first capture a notion of the complete documentation — as here — of a phase of development.
 - ★ The documentation for a phase of development is complete
 - ★ if all there is to be documented — at a certain level of abstraction — has been so documented!
 - ★ The idea of “all there is to be documented” is explained in a later lecture.

- It is thus important to also capture a notion of abstract versus concrete documentation — as here — of a phase of development.
 - ★ The phase documentation can be more or less abstract, i.e., more or less concrete.
 - ★ The phase documentation is abstract if primarily properties have been described.
 - ★ The phase documentation is concrete if primarily a model in terms of either a computable program, or a model in terms of such discrete mathematical notions as sets, Cartesians, lists, maps, etc., has been presented.
- The distinction between stages and steps is basically a pragmatic distinction.
- That is, there is no “hard” theoretical basis for making that distinction, but there are good, sensible, practical reasons for doing so.

Characterisation 1.28 By a *development stage* we shall understand a set of development activities

- which either starts from nothing and results in a complete phase documentation,
- or which starts from a complete phase documentation of stage kind, and results in a complete phase documentation of another stage kind

Characterisation 1.29 By a *stage kind* we shall loosely understand a way of characterising a set of development documents as being comprehensive (i.e., relatively complete) and, at the same time, as specifying (describing, prescribing) a set of properties of what is being specified in such a way that other such sets of documents can be said to describe the same stage kind, or a different stage kind. ■

Example 1.10 Stage Kinds:

- Examples of domain stage kinds are:
 - ★ (d_1) business processes,
 - ★ (d_2) intrinsics,
 - ★ (d_3) support technologies,
 - ★ (d_4) management and organisation,
 - ★ (d_5) rules and regulations and
 - ★ (d_6) human behaviour.

- Examples of software design stage kinds are:
 - ★ (s_1) software architecture,
 - ★ (s_2) component design (in which the entire component structuring of a software architecture is decided),
 - ★ (s_3) module design (in which all modules of all components are designed) and
 - ★ (s_4) code.

- To properly describe what we shall wish to call a step of development it seems necessary to further elaborate on two concepts.
 - ★ First the concept of a *module of description*.
 - ◊ We already covered a version of this notion in an earlier lecture, where it was “tied” to the concept of program specification (text).
 - ◊ We now enlarge upon the module concept and speak of similar, contained domain description and requirements prescription parts.

Characterisation 1.30 Thus a *stage kind* imposes an equivalence relation on a set of sets of related documents: some sets, s_k, s'_k, \dots, s''_k as belonging to the same kind (k), other sets, s_k, s'_k, \dots, s''_k as belonging to different kinds (k, k', \dots, k''). ■

- Examples of requirements stage kinds are:
 - ★ (r_1) business process reengineering,
 - ★ (r_2) domain requirements,
 - ★ (r_3) interface requirements and
 - ★ (r_4) machine requirements.

Discussion 1.4 One may properly argue whether the following are not also *stage kinds* rather than steps: domain requirements

- (r_{21}) projection,
- (r_{22}) determination,
- (r_{23}) instantiation,
- (r_{24}) extension and
- (r_{25}) fitting.

It really is just a matter of convenience, hence pragmatics. ■

- ★ Second we refer to the concept of *refinement*.
 - ◊ We also covered a version of this notion in an earlier lecture, where it was likewise “tied” to the concept of relation between pairs of program specifications (texts).
 - ◊ We now enlarge upon the refinement concept and speak of similar refinements of domain description modules as well as requirements prescription modules.

Characterisation 1.31 By a *development step* we mean a refinement of a description module, from a more abstract to a more concrete description.

- It may now be necessary to improve upon the characterisation of the concept of stage,
- so as to make the distinction between stages and steps
- more practical.

Characterisation 1.32 By a *development stage* we mean a set of development activities

- such that some (one or more) activities have created new, externally conceivable (i.e., observable) properties of what is being described,
- whereas some (zero, one or more) other activities have refined previous properties

Domain Development Stages of Domain Development

- Within domain development we can distinguish the following major stages — on which work can beneficially be pursued basically in the order now listed:
 - ★ identification and classification of *domain stakeholders*, and
 - ★ identification and modelling, relative to identified domain stakeholder classes, of a number of *domain facets*.

- ◇ These include: modelling *business process* facets of a domain,
- ◇ modelling *intrinsic* facets of a domain,
- ◇ modelling possible *support technology* facets of a domain,
- ◇ modelling possible *management and organisation* facets of a domain,
- ◇ modelling possible *rules and regulations* facets of a domain,
- ◇ modelling possible *script* facets of a domain, and
- ◇ modelling possible *human behaviour* facets of a domain.

- We shall briefly characterise these stages shortly, and
- we cover them in detail in a much later lecture.

Characterisation 1.33 By a *business process* domain we shall understand

- one or more behavioural descriptions in which
- strategic, tactical and operational sequences of transactions of
- a business, an enterprise, a public administration, an infrastructure component,
- are given — each from possibly a number of stakeholder perspectives

The business process facet overlaps with the next facets. So be it!

Example 1.11 Railway Business Processes: A simple business process is that of a passenger inquiring, with a travel agent, about train travel possibilities; being offered some alternatives; settling for one; reserving appropriate tickets; paying and collecting these; starting the travel (i.e., train journey); being ticketed and finishing the journey.

Characterisation 1.34 By domain *intrinsic* we shall understand

- those phenomena and concepts of a domain which are basic to any of the other facets (listed below),
- with such a domain intrinsic initially covering at least one specific, hence named, stakeholder view

Example 1.12 Rail Intrinsic: Examples of rail intrinsic are: the rail net, the lines, and the stations — as seen from the passenger perspective — and the above plus the rail units (whether linear [including curved], points [switches], crossover, etc.), connectors (that allow units to be put together), etc. — as seen from the rail net signalling staff; and so on.

Characterisation 1.35 By domain *support technology* we shall understand

- ways and means of implementing certain observed phenomena

Example 1.13 Railway Support Technologies: A rail unit switch can be implemented in either of a number of support technologies: as operated purely by human power, as operated, from afar by mechanical wires, as operated electromechanically, or as operated electronically and electromechanically (say, in interlocking mode).

Characterisation 1.36 By domain *management* we shall understand such people

- who determine, formulate and thus set standards (rules and regulations, see next) concerning
 - ★ strategic,
 - ★ tactical, and
 - ★ operational decisions.

- Domain management
 - ★ ensures that these decisions are passed on to the (“lower”) levels of management, and to “floor” staff,
 - ★ makes sure that such orders, as they were, are indeed carried out,
 - ★ handles undesirable deviations in the carrying out of these orders cum decisions,
 - ★ and “backstops” complaints from lower management levels and from floor staff

Example 1.14 Railway Management: An aspect of train operator management is that some functions, being of strategic nature, are considered on a yearly basis (whether to offer new train services). Other functions, being of a tactical nature, are considered more regularly, although not daily (whether prices should be lowered or raised due to lower, or higher costs, or due to competition or lack thereof). Yet other functions being of an operational nature, and are considered, and decided upon, “from hour to hour” (rescheduling trains due to delays, etc.).

Characterisation 1.37 By domain *organisation* we shall understand

- the structuring of management and nonmanagement staff levels, and
- the allocation of
 - ★ strategic,
 - ★ tactical and
 - ★ operational concerns to within management and nonmanagement staff levels.

- Hence we mean the “lines of command”:
 - ★ who does what and
 - ★ who reports to whom, both
 - ◊ administratively, and
 - ◊ functionally

Example 1.15 Railway Organisation: Example 1.14 considered management functions. The number and specialised nature of these usually warrants corresponding organisational structures: executive management entrusted with strategic issues, mid-level management with tactical issues and “floor” (or operational) management with operational issues.

Characterisation 1.38 By a domain *rule* we shall understand

- some text which prescribes how people or equipment are expected to behave when dispatching their duty, respectively when performing their functions

Example 1.16 Railway Rules: In China: At railway stations, no two (or more) trains are allowed to enter and/or leave, including basically move around, simultaneously. In fact, train arrivals and departures must be scheduled to occur with at least 2-minute intervals. Elsewhere: A line between neighbouring stations is usually segmented into blocks with the rule that at most one train may occupy any one block, or even, in cases, with at least one “empty” (i.e., no train block) between two trains.

Characterisation 1.39 By a domain *regulation* we shall understand

- some text which prescribes what remedial actions are to be taken when it is decided that a rule has not been followed according to its intention

Example 1.17 Railway Regulations: Regulations may thus prescribe properties that must hold when rescheduling trains, for instance, negotiating with neighbouring stations, etc. Or regulations may prescribe punitive staff actions when a train driver disobeys a train signal.

Characterisation 1.40 By domain *human behaviour* we shall understand

- any of a quality spectrum of humans carrying out assigned work:
 - ★ From careful, diligent and accurate,
 - via
 - ★ sloppy despatch and
 - ★ delinquent work,
 - to
 - ★ outright criminal pursuit

Example 1.18 Railway Staff Behaviour: A railway ticket collector may check and double-check that all passengers have been duly ticketed, or may fail to do so, or may deliberately skip checking a whole carriage, etc.

Steps of Domain Development

- Steps of domain development are now to be seen as such activities
 - ★ which do not materially, i.e., in substance, change the properties of what is being described,
 - ★ but which refine, from more abstract to more concrete, their way of description.
- Other than the above, we shall not cover the issue of domain development steps in the present lecture,
- but refer to much later lecture for more details.

Topic 7 Requirements Development

- From an earlier lecture we repeat some of the below characterisations.

Characterisation 1.41 By *requirements* we shall understand a document which prescribes the desired properties of a machine: *what* the machine shall (must, not should) offer of functions and behaviours, and what entities it shall “maintain”.

Characterisation 1.42 By *requirements prescription* we mean the process — and the document which results from the process — of requirements capture, analysis and synthesis.

Characterisation 1.43 By *requirements engineering* we understand the development of requirements prescriptions: from requirements prescription via the analysis of the requirements document itself, its validation with stakeholders and its possible theory development.

SOFTWARE ENGINEERING: Domains, Requirements and Software Design		Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
3.4.1 Stages of Requirements Development		Page 153, Topic: 7, Foli: 3	Richard Piresen Plank, DK-2800 Kong Lyngby, Denmark
home:/db/vuill/3ch1/3ch1-iv	April 5, 2006, 09:00		

Stages of Requirements Development

- We see four different kinds of requirements:
 - * *business process reengineering*,
 - * *domain requirements*,
 - * *interface requirements*, and
 - * *machine requirements*.

4455 3726 Fax: +45 4450 8874 © Olsen Egner, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.cn@ipmail.com, d@informatics.imm.sjtu.cn@ipmail.com www.imm.sjtu.cn/iv

SOFTWARE ENGINEERING: Domains, Requirements and Software Design		Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
3.4.1 Stages of Requirements Development		Page 154, Topic: 7, Foli: 4	Richard Piresen Plank, DK-2800 Kong Lyngby, Denmark
home:/db/vuill/3ch1/3ch1-iv	April 5, 2006, 09:00		

- Conventionally the following terms are in circulation:
 - * *functional requirements* which approximately cover our domain requirements;
 - * *user requirements* which approximately cover our interface requirements;
 - * *non-functional requirements* which approximately cover some of our machine requirements; and
 - * *system requirements* which approximately cover some other of our machine requirements.

4455 3726 Fax: +45 4450 8874 © Olsen Egner, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.cn@ipmail.com, d@informatics.imm.sjtu.cn@ipmail.com www.imm.sjtu.cn/iv

SOFTWARE ENGINEERING: Domains, Requirements and Software Design		Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
3.4.1 Stages of Requirements Development		Page 155, Topic: 7, Foli: 5	Richard Piresen Plank, DK-2800 Kong Lyngby, Denmark
home:/db/vuill/3ch1/3ch1-iv	April 5, 2006, 09:00		

Business Process Reengineering Requirements

Characterisation 1.44 By *business process reengineering requirements* we understand

- such requirements which express assumptions about
- the future, usually changed, business process behaviour of the environment of the machine
- as brought about by the introduction of computing

4455 3726 Fax: +45 4450 8874 © Olsen Egner, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.cn@ipmail.com, d@informatics.imm.sjtu.cn@ipmail.com www.imm.sjtu.cn/iv

SOFTWARE ENGINEERING: Domains, Requirements and Software Design		Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
3.4.1 Stages of Requirements Development		Page 156, Topic: 7, Foli: 6	Richard Piresen Plank, DK-2800 Kong Lyngby, Denmark
home:/db/vuill/3ch1/3ch1-iv	April 5, 2006, 09:00		

- We suggest five domain-to-business process reengineering operations — which will be covered in a later lecture:
 - * introduction of some new and removal of some old *support technologies*,
 - * introduction of some new and removal of some old *management and organisation structures*,
 - * introduction of some new and removal of some old *rules and regulations*,
 - * introduction of some new and removal of some old work practices (relating to *human behaviours*), and related *access rights* (i.e., password authentication, authorisation), and
 - * related *scripts*.

Business Process Reengineering and Domain Requirements

- So in setting out, initially, acquiring (eliciting, “extracting”) requirements,
- the requirements engineer naturally starts “in” or “with” the domain.
- That is, asks questions, of or to the stakeholders, that eventually should lead to the formulation of business process reengineering and domain requirements.

Steps of Requirements Development

- Steps of requirements development are now to be seen as such activities
 - ★ which do not materially, i.e., in substance, change the properties of what is being prescribed,
 - ★ but which refine, from more abstract to more concrete, their way of prescription.
- Other than the above, we shall not cover the issue of requirements development steps in the present lecture,
- but refer to a much later lecture for more details.

Topic 8
Computing Systems Design

- Given a comprehensive set of requirements, including, notably, machine requirements,
- one is then ready to tackle, systematically, the issue of implementing these requirements.
- Usually these requirements not only, as their main implication, direct us to design software,
- but also in many instances imply hardware design.
- In other words: computing systems design derives from requirements.

4035 3726 Fax: +45 4450 3874 © Olsen Egner, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.cn@iprnet.com, d@informatics.imm.sjtu.cn@iprnet.com URL: www.imm.sjtu.cn/

SOFTWARE ENGINEERING: Domains, Requirements and Software Design		Volume 3	Department of Computer Science and Engineering Institute of Informatics and Mathematical Modelling Technical University of Denmark
3.5.1 Stages and Steps of Hardware Design		Page 166, Topic: 8, Foli: 2	Richard Preece, Peter, DK-2800 Kong Lyngby, Denmark
home:/db/vollf/3ch1/3ch1-v	April 5, 2006, 09:00		

Stages and Steps of Hardware Design

- Performance, dependability and platform requirements typically imply a need for rather direct considerations of hardware — whether
 - ★ computers, computer peripherals, or sensory and actuator technologies.
- By stages and steps of hardware design we thus mean such which determine
 - ★ the overall composition of hardware: information technology units, buses, etc., and their interfaces, and
 - ★ the specific design of information technology units and buses, and so on.

4035 3726 Fax: +45 4450 3874 © Olsen Egner, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.cn@iprnet.com, d@informatics.imm.sjtu.cn@iprnet.com URL: www.imm.sjtu.cn/

home:/db/vollf/3ch1/3ch1-v	April 5, 2006, 09:00		

- Sometimes trade-off decisions have to be made as to whether a required function or behaviour is to be implemented in hardware or in software. These are called *codesign* decisions.
- Other than just mentioning these facts here, we shall not cover the subject till a much, much later lecture.

4035 3726 Fax: +45 4450 3874 © Olsen Egner, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.cn@iprnet.com, d@informatics.imm.sjtu.cn@iprnet.com URL: www.imm.sjtu.cn/

home:/db/vollf/3ch1/3ch1-v	April 5, 2006, 09:00		

Stages of Software Design

- We have briefly mentioned the problem before:
 - ★ sometimes a set of requirements and a set of (domain) assumptions on the stability of the environment and the execution platform
 - ★ allow us to first develop a high-level, i.e., abstract, software design from domain (and possibly some interface) requirements.
 - ★ At other times these assumptions are such (i.e., imply instability, such) that we must first, defensively, develop a less high-level, i.e., a less abstract, software design from machine requirements.

4035 3726 Fax: +45 4450 3874 © Olsen Egner, Frederik 11, DK-2800 Høvd, Denmark E-mail: d@informatics.imm.sjtu.cn@iprnet.com, d@informatics.imm.sjtu.cn@iprnet.com URL: www.imm.sjtu.cn/

- In the former case we say that we are first designing a
 - ★ *software architecture*: something that very directly reflects what the user most directly expects.
- In the latter case we say that we are first designing a
 - ★ *software component and module structure*: something that very directly reflects what some machine requirements imply.
- The boundary between the two design choices is not sharp.

- It is possible to identify other software design stages.
 - ★ Some may involve “conversion” from informal (or formal, abstract specification) language specifications to the identification and (hence) reuse of existing, “ready-made” and/or instantiatable (i.e., parameterisable) “off-the-shelf” (OTS) modules and components.
 - ★ Others involve conversion from informal (or formal, abstract specification) language specifications to formal (say, programming) language specifications, without the use of OTS software. This stage includes the final coding stage.
- Also here the boundaries are usually fuzzy.

Steps of Software Design

- We have, for these lectures, assumed that the student already has some knowledge of programming, i.e., of software design, albeit at a perhaps rather concrete, i.e., coding, level.
- In line with this assumption we shall not treat the important concept of software refinement.

- Instead we shall assume that the student has studied, or will study, such topics as:
 - ★ Dijkstra’s *Discipline of Programming*,
 - ★ Gries’ *Science of Programming*,
 - ★ Reynolds’ *Craft of Programming*,
 - ★ Hehner’s *Logic and Practical Theory of Programming*,
 - ★ Jones’ *Systematic Software Development*,
 - ★ Morgan’s *Refinement Calculus* or
 - ★ Back and von Wright’s (earlier) *Refinement Calculus*.
- In a (much) later lectures we shall, however, briefly illustrate notions of software design refinement.

Topic 9
Discussion: Phases, Stages and Steps
Iterations of Phases, Stages and Steps

- Ideally it would be nice if a software development could proceed linearly,
 - ★ from domain development,
 - ★ via requirements development,
 - ★ to software design.

- But reality seldom permits linear thinking and development.
- Instead one often encounters, in software developments which span the three phases, that they iterate:
 - forwards and backwards between temporally neighbouring, even further temporally spaced phases.
 - Figure 1.2 attempts to illustrate this iteration.

Figure 1.2: A diagramming of the iterative triptych phase development

Concurrency of Phases, Stages and Steps

- Usually phases are developed, one at a time.
 - ★ First the domain phase is developed,
 - ★ then the requirements phase, and
 - ★ finally the software design phase.
- For stages of a phase and steps of different stages one may sometimes be able to carry out their development concurrently,
 - ★ that is, by different teams of developers at the same,
 - ★ or at least in partially overlapping time intervals.
- Stage of domain modelling usually follow the sequential order shown in Fig. 1.3.

Page 178, Topic: 9, Foli: 6

home:/db/vallf/3ch1/3ch1-vi

- Typically
 - ★ the domain requirements,
 - ★ the interface requirements and
 - ★ the machine requirements stages
 can be developed independently, i.e., concurrently.
- Independent development is also appropriate for the individual “steps” within machine requirements:
 - ★ performance,
 - ★ dependability,
 - ★ maintainability,
 - ★ platform, and
 - ★ documentation requirements steps.

Topic 10

The Triptych Process Model — A First View

The Concept of a Process Model

- In software development many teams of many people each may have to collaborate
 - ★ over long periods of time and
 - ★ over geographically widely distributed locations.
- It is therefore of utmost importance that clear guidelines, principles, techniques and tools are established and are agreed upon by all teams and people involved.
- The concept of a *software development process model* and its enunciation serves this role.

The Concept of a Process Model

April 5, 2006, 09:00

Page 181, Topic: 10, Foli: 2

home:/db/vallf/3ch1/3ch1-vi

Characterisation 1.48 By a *software development process model* we shall understand

- a set of guidelines for how to start, conduct and end a software development project,
- a set of principles and techniques for decomposing these parts (start, conduct and end) into smaller, more manageable parts, and
- a set of principles, techniques and tools for what to do in, and how to do, these smaller parts

• In this lecture we shall thus very briefly summarise the basic ideas of the software development process model that these lectures are based upon.

Topic 11

Conclusion to Chapter 1

It is time to complete this long introductory survey chapter.

Summary

We have introduced crucial aspects of our approach to software development.

- *Definitions of software engineering:* First we brought in “old” and “new” definitions and characterisations of “what is software engineering”.
- *The triptych of software engineering:* Then we surveyed the three key phases of our unique approach to software development: domain engineering, requirements engineering and software design.

4525 2726 Fax: +45 4450 2874

© Olsen Egner, Frederik 11, DK-2800 Høvd, Denmark

E-mail: dahl@immi.dtu.dk, spjorn@ipm.dtu.dk, dines@ipm.dtu.dk, URL: www.immi.dtu.dk

- *Phases, stages and steps of software development:* We reviewed these three phases and further suggested stages and steps of development within these phases and stages. We invite the reader to recapitulate the stages.
- *Software development process models:* We very briefly broached the topic of process models, in particular the one brought forward by this book. This process model will be enlarged upon in subsequent lectures.
